AXIS M1033-W Network Camera

User Manual
About this document
This manual is intended for administrators and users of AXIS M1033-W Network Camera, and is applicable to firmware 5.50 and later. It includes instructions for using and managing the product on your network. Previous experience of networking will be of use when using this product. Some knowledge of UNIX or Linux-based systems may also be useful when developing shell scripts and applications. Later versions of this document will be posted at www.axis.com. See also the product’s online help, available through the web-based interface.

Legal Considerations
Video and audio surveillance can be regulated by laws that vary from country to country. Check the laws in your local region before using this product for surveillance purposes.

This product includes one (1) H.264 decoder license and one (1) AAC decoder license. To purchase further licenses, contact your reseller.

Liability
Every care has been taken in the preparation of this document. Please inform your local Axis office of any inaccuracies or omissions. Axis Communications AB cannot be held responsible for any technical or typographical errors and reserves the right to make changes to the product and manuals without prior notice. Axis Communications AB makes no warranty of any kind with regard to the material contained within this document, including, but not limited to, the implied warranties of merchantability and fitness for a particular purpose. Axis Communications AB shall not be liable nor responsible for incidental or consequential damages in connection with the furnishing, performance or use of this material. This product is only to be used for its intended purpose.

Intellectual Property Rights
Axis AB has intellectual property rights relating to technology embodied in the product described in this document. In particular, and without limitation, these intellectual property rights may include one or more of the patents listed at www.axis.com/patent.htm and one or more additional patents or pending patent applications in the US and other countries.

This product contains licensed third-party software. See the menu item “About” in the product’s user interface for more information.

This product contains source code copyright Apple Computer, Inc., under the terms of Apple Public Source License 2.0 (see www.opensource.apple.com/psl). The source code is available from https://developer.apple.com/bonjour/.

Equipment Modifications
This equipment must be installed and used in strict accordance with the instructions given in the user documentation. This equipment contains no user-serviceable components. Unauthorized equipment changes or modifications will invalidate all applicable regulatory certifications and approvals.

Trademark Acknowledgments
AXIS COMMUNICATIONS, AXIS, ETRAX, ARTEC and VAPIX are registered trademarks or trademarked symbols of Axis AB in various jurisdictions. All other company names and products are trademarks or registered trademarks of their respective companies.

Apple, Boa, Apache, Bonjour, Ethernet, Internet Explorer, Linux, Microsoft, Mozilla, Real, SMPTE, QuickTime, UNIX, Windows, Windows Vista and WWWW are registered trademarks of the respective holders. Java and all Java-based trademarks and logos are trademarks or registered trademarks of Oracle and/or its affiliates. UPIPM is a certification mark of the UPIPM Implementers Corporation.

WPA, WPA2 and Wi-Fi Protected Setup are marks of the Wi-Fi Alliance.

Regulatory Information

Europe

CE 1177 This product complies with the applicable CE marking directives and harmonized standards:

A copy of the original declaration of conformity may be obtained from Axis Communications AB. See Contact Information on page 4.

Electromagnetic Compatibility (EMC)
This equipment has been designed and tested to fulfill applicable standards for:
  • Radio frequency emission when installed according to the instructions and used in its intended environment.
  • Immunity to electrical and electromagnetic phenomena when installed according to the instructions and used in its intended environment.

USA
This equipment has been tested using a shielded network cable (STP) and found to comply with the limits for a Class B digital device, pursuant to part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference in a residential installation. This equipment generates, uses, and can radiate radio frequency energy and, if not installed and used in accordance with the instructions, may cause harmful interference to radio communications. However, there is no guarantee that interference will not occur in a particular installation. If this equipment does cause harmful interference to radio or television reception, which can be determined by turning the equipment off and on, the user is encouraged to try to correct the interference by one or more of the following measures:
  • Reorient or relocate the receiving antenna.
  • Increase the separation between the equipment and receiver.
  • Connect the equipment into an outlet on a circuit different from that to which the receiver is connected.

Consult the dealer or an experienced radio/TV technician for help.

The product shall be connected using a shielded network cable (STP) that is properly grounded.

Canada
This digital apparatus complies with CAN ICES-3 (Class B). The product shall be connected using a shielded network cable (STP) that is properly grounded.

Cet appareil numérique est conforme à la norme CAN NMB-3 (classe B). Le produit doit être connecté à l’aide d’un câble réseau blindé (STP) qui est correctement mis à la terre.

Europe
This digital equipment fulfills the requirements for RF emission according to the Class B limit of EN 55022. The product shall be connected using a shielded network cable (STP) that is properly grounded.

This product fulfills the requirements for immunity according to EN 61000-6-1 residential, commercial and light-industrial environments.

This product fulfills the requirements for immunity according to EN 61000-6-2 industrial environments.

This product fulfills the requirements for immunity according to EN 55024 office and commercial environments.

Australia/New Zealand
This digital equipment fulfills the requirements for RF emission according to the Class B limit of AS/NZS CISPR 22. The product shall be connected using a shielded network cable (STP) that is properly grounded.

Japan
この装置は、クラスB情報技術装置です。この装置は、家庭環境で使用することを目的としています。この装置がラジオ受信機等に近接して使用されること、受信障害を引き起こすことがあります。取扱説明書に従って正しい取り扱いをして下さい。本製品は、シールドネットワークケーブル(STP)を使用して接続してください。また適切に接地してください。

Korea
이 기기는 가정용(8급) 전자파적합기기로서 주로 가정에서 사용하는 것을 목적으로 하며, 모든 지역에서 사용할 수 있습니다. 적절히 접지된 STP (shielded twisted pair) 게이블을 사용하여 제품을 연결 하십시오.
Radio Transmission
This equipment may generate or use radio frequency energy. The user should not be allowed to operate this equipment if an unauthorized change or modification is made.

USA
This device complies with Part 15 of the FCC Rules. Operation is subject to the following two conditions: (1) this device may not cause harmful interference, and (2) this device must accept any interference received, including interference that may cause undesired operation.

This product complies with FCC radiation exposure limits for an uncontrolled environment. Avoid operating this product at a distance less than 20 cm (7.9 in) from the user.

Canada
This device complies with Industry Canada licence-exempt RSS standard(s). Operation is subject to the following two conditions: (1) this device may not cause interference, and (2) this device must accept any interference, including interference that may cause undesired operation of the device.

This product complies with IC radiation exposure limits for an uncontrolled environment. Avoid operating this product at a distance less than 20 cm (7.9 in) from the user.

The present appareil est conforme aux CNR d'Industrie Canada applicables aux appareils radio exempts de licence. L'exploitation est autorisée aux deux conditions suivantes : (1) l'appareil ne doit pas produire de brouillage, et (2) l'utilisateur de l'appareil doit accepter tout brouillage radioélectrique subi, même si le brouillage est susceptible d'en compromettre le fonctionnement.

Ce produit est conforme aux limites d'exposition aux radiations IC pour un environnement non contrôlé. Évitez d'utiliser ce produit à une distance inférieure à 20 cm (7.9 po) de l'utilisateur.

Europe
Hereby, Axis Communications AB declares that this product is in compliance with the essential requirements and other relevant provisions of Directive 1999/5/EC.

FR
Par la présente Axis Communications AB déclare que l’appareil ce produit est conforme aux exigences essentielles et aux autres dispositions pertinentes de la directive 1999/5/CE.

DE
Hiermit erklärt Axis Communications AB, dass sich dieses Produkt in Übereinstimmung mit den grundlegenden Anforderungen und den anderen relevanten Vorschriften der Richtlinie 1999/5/EG befindest.

IT
Con la presente Axis Communications dichiara che questo prodotto è conforme ai requisiti essenziali ed alle altre disposizioni pertinenti stabilite dalla direttiva 1999/5/CE.

ES
Por medio de la presente Axis Communications AB declara que el presente producto cumple con los requisitos esenciales y cualesquiera otras disposiciones aplicables o exigibles de la Directiva 1999/5/CE.

FI
Axis Communications AB vakuuttaa täten että tämä tuote tyypin laite on direktiivin 1999/5/EY oleellisten vaatimusten ja sitä koskevien direktiivin muiden ehtojen mukainen.

NL
Hierbij verklaart Axis Communications AB dat het toestel in overeenstemming is met de essentiële eisen en de andere relevante bepalingen van richtlijn 1999/5/EG.

SV
Härmed intygar Axis Communications AB att denna produkt står i överensstämmelse med de väsentliga egenskapsskrav och övriga relevanta bestämmelser som framgår av direktiv 1999/5/EG.

DA
Undertegneede Axis Communications AB erklærer herved, at følgende udstyr overholder de væsentlige krav og øvrige relevante krav i direktiv 1999/5/EG.

PT
Axis Communications AB declara que este produto está conforme com os requisitos essenciais e outras disposições da Directiva 1999/5/CE.

WARNING

• Risk of explosion if the battery is incorrectly replaced.
• Replace only with an identical battery or a battery which is recommended by Axis.
• Dispose of used batteries according to local regulations or the battery manufacturer’s instructions.

Disposal and Recycling
When this product has reached the end of its useful life, dispose of it according to local laws and regulations. For information about your nearest designated collection point, contact your local authority responsible for waste disposal. In accordance with local legislation, penalties may be applicable for incorrect disposal of this waste.

Europe

This symbol means that the product shall not be disposed of together with household or commercial waste. Directive 2012/19/EU on waste electrical and electronic equipment (WEEE) is applicable in the European Union member states. To prevent potential harm to human health and the environment, the product must be disposed of in an approved and environmentally safe recycling process. For information about your nearest designated collection point, contact your local authority responsible for waste disposal. Businesses should contact the product supplier for information about how to dispose of this product correctly.

This product complies with the requirements of Directive 2011/65/EU on the restriction of the use of certain hazardous substances in electrical and electronic equipment (RoHS).

China

This product complies with the requirements of the legislative act Administration on the Control of Pollution Caused by Electronic Information Products (ACPEIP).

Safety Information

Hazard Levels

- **DANGER**: Indicates a hazardous situation which, if not avoided, will result in death or serious injury.
- **WARNING**: Indicates a hazardous situation which, if not avoided, could result in death or serious injury.
- **CAUTION**: Indicates a hazardous situation which, if not avoided, could result in minor or moderate injury.
- **NOTICE**: Indicates a situation which, if not avoided, could result in damage to property.

Other Message Levels

- **Important**: Indicates significant information which is essential for the product to function correctly.
- **Note**: Indicates useful information which helps in getting the most out of the product.

AXIS M1033-W Network Camera

Hardware Overview

1 Status LED indicator
2 Focus ring
3 Lens
4 Microphone
5 Speaker
6 PIR sensor
7 Light (white illumination LED)
8 Network connector (RJ-45)
9 Power connector
10 Lock ring
11 I/O terminal connector
12 Control button
13 WLAN pairing button
14 Power LED indicator
15 Network LED indicator
16 Wireless LED indicator
17 Part number (P/N) & Serial number (S/N)

The Axis product is equipped with a lens with manual focus. It is delivered with the lens prefocused and manual focusing is usually not required.

**Note**

Only change the focus if required, for example if the image is blurry.

**Connectors and Buttons**

For technical specifications, see page 63.
AXIS M1033-W Network Camera

Hardware Overview

Network Connector
RJ45 Ethernet connector.

**NOTICE**
The product shall be connected using a shielded network cable (STP). All cables connecting the product to the network shall be intended for their specific use. Make sure that the network devices are installed in accordance with the manufacturer’s instructions. For information about regulatory requirements, see Electromagnetic Compatibility (EMC) on page 2.

I/O Connector
Use with external devices in combination with, for example, tampering alarms, motion detection, event triggering, time lapse recording and alarm notifications. In addition to the 0 V DC reference point and power (DC output), the I/O connector provides the interface to:

- **Digital output** – For connecting external devices such as relays and LEDs. Connected devices can be activated by the VAPIX® Application Programming Interface, output buttons on the Live View page or by an Action Rule. The output will show as active (shown under System Options > Ports & Devices) if the alarm device is activated.

- **Digital input** – An alarm input for connecting devices that can toggle between an open and closed circuit, for example: PIRs, door/window contacts, glass break detectors, etc. When a signal is received the state changes and the input becomes active (shown under System Options > Ports & Devices).

Power Connector
Mini DC connector. Use the supplied adapter.

Control Button
For location of the control button, see Hardware Overview on page 8.

The control button is used for:

- Enabling the Focus Assistant. Press and very quickly release the Control button.
- Resetting the product to factory default settings. See page 58.
- Connecting to an AXIS Video Hosting System service. See page 47. To connect, press and hold the button for about 3 seconds until the Status LED flashes green.
- Connecting to AXIS Internet Dynamic DNS Service. See page 47. To connect, press and hold the button for about 3 seconds.

LED Indicators

**Note**
- The Status LED can be configured to be unlit during normal operation. To configure, go to Setup > System Options > Ports & Devices > LED. See the online help for more information.
- The Status LED can be configured to flash while an event is active.
- The Status LED can be configured to flash for identifying the unit. Go to Setup > System Options > Maintenance.

<table>

AXIS M1033-W Network Camera

Access the Product

Access the Product

To install the Axis product, see the Installation Guide supplied with the product.

The product can be used with most operating systems and browsers. The recommended browsers are

- Internet Explorer® with Windows®
- Safari® with OS X®
- Chrome™ or Firefox® with other operating systems.

See Technical Specifications on page 63.

To view streaming video in Internet Explorer, allow installation of AXIS Media Control (AMC) when prompted.

The Axis product includes one (1) H.264 decoder license for viewing video streams and one (1) AAC audio license. The licenses are automatically installed with AMC. The administrator can disable the installation of the decoders, to prevent installation of unlicensed copies.

Note

- QuickTime™ is also supported for viewing H.264 streams and for audio.
- If your computer restricts the use of additional software components, the product can be configured to use a Java applet for viewing Motion JPEG.

Access from a Browser

1. Start a browser (Chrome, Internet Explorer, Firefox, Safari).
2. Enter the IP address or host name of the Axis product in the browser’s Location/Address field.

   To access the product from a Mac computer (OS X), go to Safari, click on Bonjour and select the product from the drop-down list.

   If you do not know the IP address, use AXIS IP Utility to locate the product on the network. For information about how to discover and assign an IP address, see the Installation and Management Software CD or the document Assign an IP Address and Access the Video Stream on Axis Support web at www.axis.com/techsup

   Note

   To show Bonjour as a browser bookmark, go to Safari > Preferences.

3. Enter your user name and password. If this is the first time the product is accessed, the root password must first be configured. For instructions, see Set the Root Password on page 12.
4. The product’s Live View page opens in your browser.

   Note

   The controls and layout of the Live View page may have been customized to meet specific installation requirements and user preferences. Consequently, some of the examples and functions featured here may differ from those displayed in your own Live View page.

Access from the Internet

Once connected, the Axis product is accessible on your local network (LAN). To access the product from the Internet you must configure your network router to allow incoming data traffic to the product. To do this, enable the NAT-traversal feature, which will attempt to automatically configure the router to allow access to the product. This is enabled from Setup > System Options > Network > TCP/IP Advanced.
AXIS M1033-W Network Camera

Access the Product

For more information, see NAT traversal (port mapping) for IPv4 on page 49. See also AXIS Internet Dynamic DNS Service at www.axiscom.net

For Technical notes on this and other topics, visit the Axis Support web at www.axis.com/techsup

Set the Root Password

To access the Axis product, you must set the password for the default administrator user root. This is done in the Configure Root Password dialog, which opens when the product is accessed for the first time.

To prevent network eavesdropping, the root password can be set via an encrypted HTTPS connection, which requires an HTTPS certificate. HTTPS (Hypertext Transfer Protocol over SSL) is a protocol used to encrypt traffic between web browsers and servers. The HTTPS certificate ensures encrypted exchange of information. See HTTPS on page 43.

The default administrator user name root is permanent and cannot be deleted. If the password for root is lost, the product must be reset to the factory default settings. See Reset to Factory Default Settings on page 58.

To set the password via a standard HTTP connection, enter it directly in the dialog.

To set the password via an encrypted HTTPS connection, follow these steps:

1. Click Use HTTPS.
   
   A temporary certificate (valid for one year) is created, enabling encryption of all traffic to and from the product, and the password can now be set securely.

2. Enter a password and then re-enter it to confirm the spelling.

3. Click OK. The password has now been configured.

Set Power Line Frequency

Power line frequency is set the first time the Axis product is accessed and can only be changed from Plain Config (see page 58) or by resetting the product to factory default.

Select the power line frequency (50 Hz or 60 Hz) used at the location of the Axis product. Selecting the wrong frequency may cause image flicker if the product is used in fluorescent light environments.

When using 50 Hz, the maximum frame rate is limited to 25 fps.

Note

Power line frequency varies depending on geographic region. The Americas usually use 60 Hz, whereas most other parts of the world use 50 Hz. Local variations could apply. Always check with the local authorities.

The Live View Page

The controls and layout of the Live View page may have been customized to meet specific installation requirements and user preferences. Consequently, some of the examples and functions featured here may differ from those displayed in your own Live View page. The following provides an overview of each available control.
AXIS M1033-W Network Camera

Access the Product

Controls on the Live View Page

Select a stream profile for the Live View page from the Stream Profile drop-down list. For information about how to configure stream profiles, see page 21.

Click Pulse to activate the built-in light for a defined period of time, for example 20 seconds.

Click the Active/Inactive buttons to manually turn the built-in light on and off.

Use the Slider to control the brightness of the built-in light, slide left to dim and slide right do to brighten.

Click Pulse to activate the product’s output port for a defined period of time. For information about how to enable and configure output buttons, see page 28.

Click the Active/Inactive buttons to manually activate and inactive the product’s output port. For information about how to enable and configure output buttons, see page 28.

The Manual Trigger button is used to trigger an action rule from the Live View page. For information about how to configure and enable the button, see Manual Trigger on page 13.

Click Snapshot to save a snapshot of the video image. This button is primarily intended for use when the AXIS Media Control viewer toolbar is not available. Enable this button from Live View Config > Action Buttons.

The Audio clip drop-down list allows you to play an audio clip from the Live View page. Select the audio clip and click the Play button.

Manual Trigger

The Manual Trigger is used to trigger an action rule from the Live View page. The manual trigger can for example be used to validate actions during product installation and configuration.

To configure the manual trigger:

1. Go to Setup > Events.
2. Click Add to add a new action rule.
3. From the Trigger drop-down list, select Input Signal.
4. From the second drop-down list, select Manual Trigger.
5. Select the desired action and configure the other settings as required.

For more information about action rules, see Events on page 35.

To show the manual trigger buttons in the Live View page:

1. Go to Setup > Live View Config.
AXIS M1033-W Network Camera

Access the Product

2. Under Action Buttons, select Show manual trigger button.

AXIS Media Control viewer toolbar

The AXIS Media Control viewer toolbar is available in Internet Explorer only. See AXIS Media Control (AMC) on page 16 for more information. The toolbar displays the following buttons:

- The **Play** button connects to the Axis product and starts playing a media stream.
- The **Stop** button stops the media stream.
- The **Snapshot** button takes a snapshot of the video image. The location where the image is saved can be specified in the AMC Control Panel.
- Click the **View Full Screen** button and the video image will fill the entire screen. Press ESC (Escape) on the computer keyboard to cancel full screen view.
- The **Record** button is used to record the current video stream on your computer. The location where the recording is saved can be specified in the AMC Control Panel. Enable this button from Live View Config > Viewer Settings.

AMC Audio Controls

AMC audio buttons control the speakers and microphone connected to the client computer. The buttons are only visible when audio is enabled.

- **Speaker** button – Click to turn the speakers on or off.
- **Microphone** button – Click to mute or unmute the microphone. In *Simplex – speaker only mode*, the **Microphone** and **Talk** buttons must both be active to send audio to the Axis product. Click either button to stop audio transmission.

  Use the slider to control the volume of the speakers and the microphone.

- **Half-duplex mode**
  - The **Talk/Listen** button is used to switch between sending and receiving audio. The button can be configured from the Audio tab in the AMC Control panel:
    - Push-To-Talk mode: Click and hold the button to talk/send. Release the button to listen.
    - Toggle mode: Click once to switch between talking and listening.

- **Simplex – speaker only mode**
  - To send audio, the **Talk** and **Microphone** buttons must both be active. Click either button to stop audio transmission.

PTZ Controls

**Note**

These controls are available if digital PTZ is enabled in the selected view area, see View Area on page 22.

- Click the **Emulate joystick mode** button and click in the image to move the camera view in the direction of the mouse pointer.
- Click the **Center mode** button and click in the image to center the camera view on that position.

The center mode button could also be used to zoom in on a specific area. Click in the image and drag to draw a rectangle surrounding the area to be magnified. To zoom out, rotate the mouse wheel.
Access the Product

Click the Ctrl panel button to open the PTZ control panel which provides additional PTZ controls. User-defined buttons can also appear in the Control panel. See Controls on page 30.

Select a PTZ preset position to steer the camera view to the saved position. See Preset Positions on page 29.

Pan and Tilt bars – Use the arrows to pan and tilt the camera view, or click on a position on the bar to steer the camera view to that position.

Zoom bar – Use the arrows to zoom in and out, or click on a position on the bar to zoom to that position.

The PTZ controls can be disabled under PTZ > Advanced > Controls, see Controls on page 30.
Media Streams

The Axis product provides several audio and video stream formats. Your requirements and the properties of your network will determine the type you use.

The Live View page in the product provides access to H.264 and Motion JPEG video streams, audio streams and to the list of available stream profiles. Other applications and clients can access video and audio streams directly, without going via the Live View page.

**How to Stream H.264**

H.264 can, without compromising image quality, reduce the size of a digital video file by more than 80% compared with the Motion JPEG format and as much as 50% more than the MPEG-4 standard. This means that much less network bandwidth and storage space are required for a video file. Or seen another way, much higher video quality can be achieved for a given bit rate.

Deciding which combination of protocols and methods to use depends on your viewing requirements, and on the properties of your network. The available options in AXIS Media Control are:

<table>
<thead>
<tr>
<th>Unicast RTP</th>
<th>This unicast method (RTP over UDP) is used for live unicast video, especially when it is important to always have an up-to-date video stream, even if some frames are dropped.</th>
</tr>
</thead>
<tbody>
<tr>
<td>RTP over RTSP</td>
<td>This unicast method (RTP tunneled over RTSP) is useful as it is relatively simple to configure firewalls to allow RTSP traffic.</td>
</tr>
<tr>
<td>RTP over RTSP over HTTP</td>
<td>This unicast method can be used to traverse firewalls. Firewalls are commonly configured to allow the HTTP protocol, thus allowing RTP to be tunneled.</td>
</tr>
<tr>
<td>Multicast RTP</td>
<td>This method (RTP over UDP) should be used for live multicast video. The video stream is always up-to-date, even if some frames are dropped. Multicasting provides the most efficient usage of bandwidth when there are large numbers of clients viewing simultaneously. A multicast cannot however, pass a network router unless the router is configured to allow this. It is not possible to multicast over the Internet, for example. Note also that all multicast viewers count as one unicast viewer in the maximum total of 20 simultaneous connections.</td>
</tr>
</tbody>
</table>

Unicasting is used for video-on-demand transmission so that there is no video traffic on the network until a client connects and requests the stream. Note that there are a maximum of 20 simultaneous unicast connections.

**Note**

H.264 is licensed technology. The Axis product includes one H.264 viewing client license. Installing additional unlicensed copies of the client is prohibited. To purchase additional licenses, contact your Axis reseller.

**MJPEG**

This format uses standard JPEG still images for the video stream. These images are then displayed and updated at a rate sufficient to create a stream that shows constantly updated motion.

The Motion JPEG stream uses considerable amounts of bandwidth, but provides excellent image quality and access to every image contained in the stream. The recommended method of accessing Motion JPEG live video from the Axis product is to use the AXIS Media Control in Internet Explorer in Windows.

**AXIS Media Control (AMC)**

AXIS Media Control (AMC) in Internet Explorer in Windows is the recommended method of accessing live video from the Axis product.
The AMC Control Panel can be used to configure various video and audio settings. Please see the AXIS Media Control User’s Manual for more information.

The AMC Control Panel is automatically installed on first use, after which it can be configured. Open the AMC Control Panel from:

- Windows Control Panel (from the Start screen or Start menu)
- Alternatively, right-click the video image in Internet Explorer and click Settings.

**Alternative Methods of Accessing the Video Stream**

You can also access video and images from the Axis product in the following ways:

- **Motion JPEG server push** (if supported by the client, Chrome or Firefox, for example). This option maintains an open HTTP connection to the browser and sends data as and when required, for as long as required.
- **Still JPEG images in a browser.** Enter the path `http://<ip>/axis-cgi/jpg/image.cgi`
- **Windows Media Player.** This requires AXIS Media Control and the H.264 decoder to be installed. The following paths can be used:
  - Unicast via RTP: `axrtpu://<ip>/axis-media/media.amp`
  - Unicast via RTSP: `axrtp://<ip>/axis-media/media.amp`
  - Unicast via RTSP, tunneled via HTTP: `axrtphttp://<ip>/axis-media/media.amp`
  - Multicast: `axrtpm://<ip>/axis-media/media.amp`
- **QuickTime™.** The following paths can be used:
  - `rtsp://<ip>/axis-media/media.amp`
  - `rtsp://<ip>/axis-media/media.3gp`
Note

- `<ip>` = IP address
- The Axis product supports QuickTime 6.5.1 and later.
- QuickTime may add latency to the video stream.
- It may be possible to use other players to view the H.264 stream using the paths above, although Axis does not guarantee this.

Access Audio Streams

The Live View page provides access to audio through AXIS Media Control; in addition audio can be accessed in the following ways:

- **VAPIX® Application Programming Interface (API)** For more information, visit www.axis.com/developer
- **Windows Media Player** supports simplex audio. The following paths can be used:
  - Unicast via RTP: `axrtpu://<ip>/axis-media/media.amp`
  - Unicast via RTSP: `axrtsp://<ip>/axis-media/media.amp`
  - Unicast via RTSP, tunneled via HTTP: `axrtsphttp://<ip>/axis-media/media.amp`
  - Multicast: `axrtpm://<ip>/axis-media/media.amp`
- **QuickTime™** supports G.711 and AAC audio encoding. The following paths can be used:
  - `rtsp://<ip>/axis-media/media.amp`
  - `rtsp://<ip>/axis-media/media.3gp`
- **The Java applet** supports simplex audio with G.711 encoding.
Set Up the Product

The Axis product can be configured by users with administrator or operator rights. To open the product's Setup pages, click Setup in the top right-hand corner of the Live View page.

- Administrators have unrestricted access to all settings.
- Operators have access to all settings except System Options

See also the online help.

Basic Setup

Basic Setup provides shortcuts to the settings that should be made before using the Axis product:

1. Users. See page 43.
2. Wireless. See page 49.
3. TCP/IP. See page 46.
4. Date & Time. See page 45.

The Basic Setup menu can be disabled from System Options > Security > Users.
Video and Audio

The video and audio settings can be used to optimize video and audio quality. You can configure the following:

- Video stream settings. See page 20.
- Stream profiles. See page 21.
- Camera settings. See page 22.
- View area. See page 22.
- Overlay image. See page 23.
- Privacy mask. See page 25.
- Audio settings. See page 25.

Set Up Video Streams

To set up the product’s video streams, go to Video & Audio > Video Stream. The video stream settings are divided into the following tabs:

- Image. See page 20.
- Audio. See page 25.

Pixel Counter

The pixel counter shows the number of pixels in an area of the image. The pixel counter is useful in situations where there is a requirement that the image is a certain size, for example in face recognition.

The pixel counter can be accessed from:

- Video & Audio > Video Stream. Under Preview, click Open and select the Show pixel counter option to enable the rectangle in the image. Use the mouse to move and resize the rectangle, or enter the number of pixels in the Width and Height fields and click Apply.
- The Live View page in Internet Explorer with AXIS Media Control (AMC) in Windows. Right-click in the image and select Pixel counter. Use the mouse to move and resize the rectangle.

Image

The default image settings can be configured under Video & Audio > Video Stream. Select the Image tab.

The following settings are available:

- Resolution. Select the default resolution.
- Compression. The compression level affects the image quality, bandwidth and file size of saved images; the lower the compression, the higher the image quality with higher bandwidth requirements and larger file sizes.
- Mirror image. If required, the image can be mirrored.
- Rotate image. If required, the image can be rotated.
• **Maximum frame rate.** To avoid bandwidth problems, the frame rate allowed to each viewer can be **Limited** to a fixed amount. Alternatively, the frame rate can be set as **Unlimited**, which means the Axis product always delivers the highest frame rate possible under the current conditions.

• **Overlay settings.** See *Overlay on page 23.*

Click **Save** to apply the new settings.

**H.264**

H.264, also known as MPEG-4 Part 10/AVC, is a video compression standard that provides high quality video streams at low bit rates. An H.264 video stream consists of different types of frames such as I-frames and P-frames. An I-frame is a complete image whereas P-frames only contain the differences from previous frames.

The H.264 stream settings can be configured from the *Video & Audio > Video Stream* page. Select the **H.264** tab. The settings defined in this page will apply to all H.264 streams that do not use a stream profile.

The **GOV length** is the number of frames between two consecutive I-frames. Increasing the GOV length may save considerably on bandwidth requirements in some cases, but may also have an adverse affect on image quality.

The Axis product supports the following **H.264 profile(s):**

• **Main.** The Main profile provides higher compression with maintained video quality compared to the Baseline profile but requires more processing power to decode.

The bit rate can be set as **Variable bit rate** (VBR) or **Constant bit rate** (CBR). VBR adjusts the bit rate according to the image complexity, using up more bandwidth for increased activity in the image, and less for lower image activity. When the activity in the scene increases, the bit rate would usually increase as well. If there is a surplus in bandwidth, this may not be an issue and selecting **Variable bit rate** (VBR) will be sufficient. But if bandwidth is limited, it is recommended to control the bit rate by selecting **Constant bit rate** (CBR). When the activity in the scene increases, VBR adjusts the bit rate according to the complexity, using up more bandwidth for increased activity in the scene, and less for lower scene activity. CBR allows you to set a target bit rate that limits the bandwidth consumption.

The CBR target bit rate works like the ceiling of a tent. It limits the bit rate, while maintaining some flexibility. The bit rate may bounce up and down within the set target but when it nears the set target value, the limitation kicks in. However, because CBR will always prioritize a continuous video stream, it allows temporary overshoots from the target bit rate. Because setting a target value prevents the bit rate from increasing, frame rate and image quality are affected negatively. To partly compensate for this, select which variable shall be prioritized, frame rate or image quality. Not setting a priority means that frame rate and image quality are equally affected.

The current bit rate can be set to appear as text overlay. Under **Overlay Settings**, select **Include text** and enter the modifier #b in the field.

To apply the settings, click **Save**.

**MJPEG**

Sometimes the image size is large due to low light or complex scenery. Adjusting the maximum frame size helps to control the bandwidth and storage used by the Motion JPEG video stream in these situations. Setting the frame size to the **Default** setting provides consistently good image quality at the expense of increased bandwidth and storage usage in low light. Limiting the frame size optimizes bandwidth and storage usage, but may give poor image quality. To prevent increased bandwidth and storage usage, the maximum frame size should be set to an optimal value.

**Stream Profiles**

A stream profile is a set of predefined stream settings including resolution, compression, frame rate and overlay settings. Stream profiles can be used:

• When setting up recording using action rules. See *Events on page 35.*

• When setting up continuous recording. See *Continuous Recording on page 40.*

• In the Live View page – select the stream profile from the **Stream profile** drop-down list.
For quick setup, use one of the predefined stream profiles. Each predefined profile has a descriptive name, indicating its purpose. If required, the predefined stream profiles can be modified and new customized stream profiles can be created.

To create a new profile or modify an existing profile, go to Setup > Video & Audio > Stream Profiles.

To select a default stream profile for the Live View page, go to Setup > Live View Config.

Camera Settings

The Video & Audio > Camera Settings page provides access to advanced image settings for the Axis product.

Image Appearance

To change Image Appearance go to the menus under Setup > Video & Audio > Camera Settings.

Increasing the Color level increases the color saturation. The value 100 gives maximum color saturation and the value 0 gives minimum color saturation.

Increasing the Sharpness can increase bandwidth usage. A sharper image might increase image noise especially in low light conditions. A lower setting reduces image noise, but the whole image will appear less sharp.

The Contrast changes the relative difference between light and dark. It can be adjusted using the slidebar.

White Balance

To change this setting go to Setup > Video & Audio > Camera Settings

White balance is used to make colors in the image appear the same regardless of the color temperature of the light source. The Axis product can be set to automatically identify the light source and compensate for its color. Alternatively, select the type of light source from the drop-down list. For a description of each available setting, see the online help.

Exposure Settings

Configure the exposure settings to suit the image quality requirements in relation to lighting, frame rate and bandwidth considerations.

Exposure value – Click in the bar to fine-tune the exposure.

Enable Backlight compensation – Enable this option if a bright spot of light, for example a light bulb, causes other areas in the image to appear too dark.

Exposure priority – When Motion is prioritized, motion blur in the image is minimized. This can be useful for recognition of moving objects such as people and vehicles. However, prioritizing motion may cause an increase in image noise, especially in low light situations. When Low noise is prioritized, image noise is minimized. The file size is reduced, which can be useful if storage space or bandwidth is limited. However, prioritizing low noise may result in a very dark image, especially in low light situations.

View Area

A view area is a cropped part of the full view. The view area is treated as a video source in Live View and has its own video stream and PTZ settings.

When setting up a view area it is recommended that the video stream resolution is the same size as or smaller than the view area size. Setting the video stream resolution larger than the view area size implies digitally scaled up video after sensor capture, requiring more bandwidth without adding image information.

To enable, go to Video & Audio > Camera Settings and select Enable View Area.

To configure the view area:

1. Go to Video & Audio > View Area.
AXIS M1033-W Network Camera

Video and Audio

2. Select an Aspect ratio and a Video stream resolution.
3. Use the mouse to move and resize the view area.
4. Select Enable PTZ to enable digital PTZ for the view area.
5. Click Save to save the settings.

Note
The PTZ functionality is useful during installation of the Axis product. Use a view area to crop out a specific part of the full view.

Overlay

Overlays are used to provide extra information, for example for forensic video analysis or during product installation and configuration. Overlays are superimposed over the video stream.

An overlay text can display the current date and time, or a text string. When using a text string, modifiers can be used to display information such as the current bit rate or the current frame rate. For information about available modifiers, see File Naming & Date/Time Formats in the online help.

It is also possible to display text when an action rule is triggered, see Use Overlay Text in an Action Rule.

To enable overlays:

1. Go to Video & Audio > Video Stream and select the Image tab.
2. To include an overlay image, select Include overlay image at the coordinates. The overlay image must first be uploaded to the Axis product, see Overlay Image.
3. To include date and time, select Include date and Include time.
4. To include a text string, select Include text and enter the text in the field. Modifiers can be used, see File Naming & Date/Time Formats in the online help.
5. Define text overlay characteristics in the relevant fields.
6. Click Save.

To modify the date and time format, go to System Options > Date & Time. See Date & Time on page 45.

Overlay Image

An overlay image is a static image superimposed over the video stream. The image, for example a company logo, is used to provide extra information or to mask a part of the image.

Since it is static, the position and size of an overlay image will remain the same regardless of resolution and Pan/Tilt/Zoom movements.

Use a privacy mask to set up a dynamic mask which will always mask the specified part of monitored area.

For more information about privacy masks, see Privacy Mask on page 25.

To use an overlay image, the image must first be uploaded to the Axis product. The uploaded image should be a Windows 24-bit BMP image with maximum 250 colors. The image width and height, in pixels, must be exactly divisible by 4 and cannot be larger than the maximum image resolution. If combining text and image overlays, take into consideration that the text overlay occupies 16 or 32 pixels in height (depending on the resolution) and has the same width as the video image.

To automatically scale the image to the resolution used by the Axis product, select the option Scale with resolution from the Transparency Settings page which is displayed when uploading in the image.

To upload an overlay image:
1. Go to Video & Audio > Overlay Image.
2. Click Browse and browse to the file.
3. Click Upload.
4. The Transparency Settings page is now displayed:
   - To make a color in the overlay image transparent, select Use transparency and enter the RGB hexadecimal value for the color. Example: To make white transparent, enter #FFFFFF.
   - For more examples of hexadecimal values, see the online help.
5. Click Save.

To select the image to use as overlay:
1. Go to Video & Audio > Overlay Image.
2. Select the image to use from the Use overlay image list and click Save.

To display the overlay image:
1. Go to Video & Audio > Video Stream and select the Image tab.
2. Under Overlay Settings, select Include overlay image at the coordinates.
3. To control the image’s position, enter the X and Y coordinates. The X=0 and Y=0 position is the top left corner. If a part of the image is positioned outside the video image, the overlay image will be moved so that the whole image is visible.
4. Click Save.

Use Overlay Text in an Action Rule

Action rules, see page 35, can display an overlay text when the rule is triggered. The text can be used to provide information for forensic video analysis, notify surveillance operators or validate triggers and actions during product installation and configuration.

To display overlay text when an action rule is triggered, the modifier #D should be used as described below. When the rule is triggered, #D will be replaced by the text specified in the action rule.

Start by enabling overlay text in the video stream:
1. Go to Video & Audio > Video Stream and select the Image tab.
2. Under Overlay Settings, select Include text.
3. Enter the modifier #D and, optionally, additional text which will be displayed also when the action rule is not active.

Create the action rule:
1. Go to Events > Action Rules
2. Click Add to create a new rule.
3. Select a Trigger and, optionally, a Schedule and Additional conditions. See the online help for details.
4. From the Actions list, select Overlay Text
5. Enter the text to display in the Text field. This is the text that #D will be replaced by.
6. Specify the Duration. The text can be displayed while the rule is active or for a fixed number of seconds.
Example
To display the text “Motion detected” when motion is detected, enter #D in the Include text field and enter “Motion detected” in the Text field when setting up the action rule.

Privacy Mask
A privacy mask is a user-defined area that prevent users from viewing parts of the monitored area. Privacy masks appear as blocks of solid color and are applied on the video stream. Privacy masks cannot be bypassed using the VAPIX® application programming interface (API).

The Privacy Mask List (Video & Audio > Privacy Mask) shows all the masks that are currently configured in the Axis product and indicates if they are enabled.

You can add a new mask, re-size the mask with the mouse, choose a color for the mask, and give the mask a name.

For more information, see the online help

Important
Adding many privacy masks may affect the product’s performance.

Set Up Audio
To change the product’s audio settings, go to Video & Audio > Audio Settings.

To include the audio stream in a video stream, go to Video & Audio > Video Stream. Under the Audio tab, select Enable audio.

Each stream profile is a separate video stream. To include the audio stream in all stream profiles, go to the audio tab in each stream profile settings page and enable audio. For more information, see Stream Profiles on page 21.

Audio Modes
The Axis product supports the following audio modes:

Full duplex – Simultaneous two-way audio allowing the Axis product to transmit and receive audio at the same time. There is no echo cancellation; if feedback loops appear, try moving the microphone or the speaker.

Half-duplex – Audio can be transmitted to and from the Axis product but only in one direction at a time. To transmit audio using the Live View page, use the Talk and Listen buttons, see AMC Audio Controls on page 14.

Simplex — Network Camera speaker only – Audio is transmitted from a client to the Axis product and can be played by a speaker connected to the product. To transmit audio using the Live View page, the Talk and MicrophoneMicrophone on buttons must both be active, see AMC Audio Controls on page 14.

Simplex — Network Camera microphone only – Audio captured by the product microphone is transmitted from the Axis product to one or more clients.

To set the audio mode, go to Video & Audio > Audio Settings and select the desired mode from the Audio mode drop-down list.

Audio Input
Use the Input gain to control the volume (dB Full Scale) of the audio input. If the sound is too low, choose a higher dB, to amplify the sound. If the sound is too high, choose a lower dB. The Level bar gives a visual representation of the audio signal level in dB relative to the full-scale input level.

- Green — the signal is at a good level.
- Yellow — the signal is becoming distorted.
- Red — the signal is distorted.
Use the Encoding option to select digital audio encoding format.

- **AAC** requires a license for both encoding and decoding. AAC is the least complicated and most widely used codec. If achieving the best possible audio quality is a priority, AAC is the recommended codec to use. An AAC license is included in the Axis product.

- **G711** is an unlicensed standard codec that is useful when integrating audio into a VoIP system

- **G726** is an unlicensed speech codec that is most commonly used within the security industry.

**Note**

If recording audio to edge storage, such as a network share, use AAC encoding.

The **Sample rate** defines the number of times per second the sound is sampled. A higher sample rate will provide better audio quality, but also requires a greater bandwidth.

Set the required **Bit rate** depending on the selected encoding. A higher bit rate will give better audio quality. A lower bit rate may have latency or delay, but will require less bandwidth.

For more information about these settings, please see the online help 🌐.

**Audio Output**

Configure the audio output settings under **Video & Audio > Audio Settings**.

**Output gain** - Control the volume (dB Full Scale) of the line audio output. If the sound is too low, choose a higher dB. If the sound is too high, choose a lower dB.

**Audio Clips**

An audio clip is a sound file that can be played when events occur or directly from the Live View page. The audio clip must first be uploaded to the Axis product or recorded by a microphone connected to the product.

To add, download, modify or remove audio clips, go to **Video & Audio > Audio Clips**. For more information see the online help 🌐.

To configure the Axis product to play audio clips when an event occurs, an action rule must be set up. For more information, see **Events on page 35**.

**Note**

Audio clips cannot be used if the product’s audio functionality is enabled. The audio functionality is enabled on the **Audio tab** under **Video & Audio > Video Stream**.

26
Configure the Live View Page

You can customize the Live View page and alter it to suit your requirements. It is possible to define the following features of the Live View page.

- Stream Profile. See page 21.
- Default Viewer for Browser. See page 27.
- Viewer Settings. See page 27.
- Action Buttons. These are the buttons described in Controls on the Live View Page on page 13.
- User Defined Links. See page 28.
- Output Buttons. See page 28.

Default Viewer for Browsers

From Live View Config > Default Viewer select the default method for viewing video images in your browser. The product attempts to show the video images in the selected video format and viewer. If this is not possible, the product overrides the settings and selects the best available combination.

<table>
<thead>

|                  | QuickTime| H.264.                                            |
|                  | Java applet| A slower imaging alternative to Server Push (Motion JPEG only). |
|                  | Still image| Displays still images only. Click the Refresh button in your browser to view a new image. |

For more information, please see the online help 🌐.

Viewer Settings

To configure options for the viewer, go to Live View Config > Viewer Settings.

- Select Show viewer toolbar to display the AXIS Media Control (AMC) or the QuickTime viewer toolbar under the video image in your browser.
- H.264 decoder installation. The administrator can disable installation of the H.264 decoder included with AXIS Media Control. This is used to prevent installation of unlicensed copies. Further decoder licenses can be purchased from your Axis reseller.
- Select Show crosshair in PTZ joystick mode to enable a cross that will indicate the center of the image in PTZ joystick mode.
**AXIS M1033-W Network Camera**

**Configure the Live View Page**

- Select Use PTZ joystick mode as default to enable joystick mode. The mode can be changed temporarily from the PTZ control panel.
- Select Enable recording button to enable recording from the Live View page. This button is available when using the AMC viewer. The recordings are saved to the location specified in the AMC Control Panel. See AXIS Media Control (AMC) on page 16.

**User Defined Links**

To display user-defined links in the Live View page, select the Show custom link option, give the link a name and then enter the URL to link to. When defining a web link do not remove the "http://" from the URL address. Custom links can be used to run scripts or activate external devices connected to the product, or they can link to a web page. Custom links defined as cgi links will run the script in the background, in a hidden frame. Defining the link as a web link will open the link in a new window.

**Light Buttons**

The built-in light on the AXIS product can be controlled directly from the Live View page by enabling the display of light buttons. To display the light buttons in the Live View Page, select the type of control from the drop-down list under Live View Config > Light Buttons:

- **Pulse** activates the light for a defined period of time. The pulse time can be set as short as 1/100 second, and as long as 60 seconds.
- **Active/Inactive** displays two buttons (on/off).
- **Slider** controls the brightness of the built-in light, slide left to dim and slide right to do to brighten.

**Output Buttons**

External I/O devices connected to the Axis product's output ports can be controlled directly from the Live View page.

To display output buttons in the Live View page:

1. Go to Setup > Live View Config.
2. Under Output Buttons, select the type of control to use:
   - Pulse activates the output for a defined period of time. The pulse time can be set from 1/100 second to 60 seconds.
   - Active/Inactive displays two buttons, one or each action.

To configure the active and inactive states, go to System Options > Ports & Devices > I/O Ports and set the port’s Normal state.

For more information about I/O ports, see I/O Ports on page 56.
AXIS M1033-W Network Camera

PTZ (Pan Tilt Zoom)

PTZ (Pan Tilt Zoom)

The PTZ menu is available if digital PTZ (pan, tilt and zoom) is enabled in the selected view area. For more information on view areas, see View Area on page 22.

Preset Positions

A preset position is a saved view that can be used to quickly steer the camera to a specific position. A preset position consists of the following values:

- Pan and tilt positions
- Zoom position

Access the Preset Positions

Preset positions can be accessed in several ways:

- By selecting the preset from the Source drop-down list in the Live View Page.
- When setting up action rules. See page 35.
- When setting up guard tours. See page 29.

Add a Preset Position

1. Go to PTZ > Preset Positions.
2. Click in the image or use the controls to steer the camera view to the desired position, see Preset Positions.
3. Enter a descriptive name in the Current position field.
4. Click Add to save the preset position.

To include the preset position name in the overlay text, go to Video & Audio, select Include overlay text and enter the modifier #P in the field. For more information about modifiers, see File Naming & Date/Time Formats in the online help.

Set the Home Position

The entire view area is treated as the Home position which is readily accessible by clicking the Home button on the Live View page and in the Preset Positions setup window.

The product can be configured to return to the Home position when the PTZ functionality has been inactive for a specified length of time. Enter the length of time in the Return to home after field and click Save. Set the time to zero to prevent the product from automatically returning to the Home position.

Guard Tour

A guard tour displays the video stream from different preset positions, one-by-one, in a predetermined order or at random and for configurable time periods. The enabled guard tour will keep running after the user has logged off or closed the browser.

To add a guard tour:

1. Go to PTZ > Guard Tour and click Add.
2. Enter a descriptive name.
3. Specify the pause length between runs.
AXIS M1033-W Network Camera

PTZ (Pan Tilt Zoom)

4. Select an available preset position and click Apply.
5. Specify the View Time in seconds or minutes.
6. Specify the View Order or select the Random view order option.
7. Click Save.

To modify or remove guard tours, go to PTZ > Guard Tour, select the guard tour in the Guard Tour List and click Modify/Remove.

Note
For products that support Limited Guard Tour, the product has a fixed minimum view time

For more information see the online help.

Advanced

Controls
Advanced PTZ settings can be configured under PTZ > Advanced > Controls.

The Panel Shortcut Command Buttons list shows the user-defined buttons that can be accessed from the Live View page’s Ctrl panel. These buttons can be used to provide direct access to commands issued using the VAPIX® application programming interface. Click Add to add a new shortcut command button.

The following PTZ controls are enabled by default:
- Pan control
- Tilt control
- Zoom control

To disable specific controls, deselect the options under Enable/Disable controls.

Control Queue

Note
- The administrator can enable and disable PTZ controls for selected users.
- To identify different users in the viewer group, cookies must be enabled on the client.
- The Control queue polltime is measured in seconds. For more information see the online help.

The administrator can set up a queue for PTZ controllers from PTZ > Control Queue. Once set up, the PTZ Control Queue buttons appear in the Live View page offering one viewer exclusive control for a limited period of time. Other users will be placed in queue.

A user who belongs to a group (see Users on page 43) with a higher PTZ priority can go before other users in the queue and take control of the product. The order of priority is as follows:
1. Administrator — An administrator takes over PTZ control regardless of who is first in queue. The administrator will be removed from the queue 60 seconds after the last PTZ control command.
2. Event — The Axis product can be configured to go to a preset position when triggered by an alarm (see Events on page 35). The event will immediately be placed first in the queue except when an administrator is in control.
3. Operator — Same as administrator but with lower priority
4. Guard Tour — A guard tour (see page 29) has PTZ control for an indefinite period of time. It may be overridden by an operator, event or administrator. The guard tour will resume when higher priority groups leave the queue.
5. **Viewer** – Multiple viewers must wait for their turn. The viewer has 60 seconds PTZ control before control is passed on to the next viewer in queue.
Detectors

Camera Tampering

Camera Tampering can generate an alarm whenever the camera is repositioned, or when the lens is covered, sprayed or severely defocused. To send an alarm, for example an email, an action rule must be set up.

To configure tampering:

1. Go to Detectors > Camera Tampering.
2. Set the Minimum duration, that is, the time that must elapse before an alarm is generated. Increase time to prevent false alarms for known conditions that affect the image.
3. Select Alarm for dark images if an alarm should be generated if lights are dimmed or turned off, or if the lens is sprayed, covered, or rendered severely out of focus.
4. Click Save.

To configure the product to send an alarm when tampering occurs:

1. Go to Events > Action Rules.
2. Click Add to set up a new action rule.
3. Enter a Name for the action rule.
4. Under Condition, select Detectors from the Trigger list.
5. Select Tampering from the list of detectors.
6. Optionally, select a schedule and set additional conditions.
7. Select the action. To send an email, select Send Notification and select a Recipient from the list of defined recipients.

Note

The While the rule is active option under Duration cannot be used with camera tampering, since camera tampering does not have a duration and once it has been triggered it will not automatically return to its untriggered state.

For more information on actions rules, see Events on page 35.

Motion Detection

Motion detection is used to generate an alarm whenever movement starts or stops in the camera view.

Motion detection is configured by defining up to 10 Include and Exclude windows:

- Include windows — define areas where motion should be detected
- Exclude windows — define areas within an Include window that should be ignored (areas outside Include windows are automatically ignored).

For instructions, see Set Up Motion Detection Windows on page 33.

To control the number of motion detection alarms, the parameters Object Size, History and Sensitivity can be adjusted. See Motion Detection Parameters on page 33.

Once motion detection windows are configured, the Axis product can be configured to perform actions when motion is detected. Possible actions include uploading images and start recording. For more information, see Set Up Action Rules on page 35.
AXIS M1033-W Network Camera

Detectors

Note
- Using the motion detection feature may decrease the product’s overall performance.
- The position of the Motion Detection Window is relative to the orientation of the Camera. Changing the orientation of the camera will also change the position of the Motion Detection Window.

Set Up Motion Detection Windows
To set up a motion detection Include Window, follow these instructions:

1. Go to Detectors > Motion Detection.
2. Select the Configure Included Windows option and click New. Select the new window in the list of windows and enter a descriptive name.
3. Adjust the size (drag the bottom right-hand corner) and the position (click on the text at the top and drag to the desired position) of the window.
4. Adjust the Object Size, History and Sensitivity profile sliders (see Motion Detection Parameters for details). Any detected motion within an active window is indicated by red peaks in the Activity window.
5. Click Save.

To exclude parts of the include window, select the Configure Excluded Windows and position the exclude window within the include window.

To delete an include or exclude window, select the window in the list of windows and click Del.

Motion Detection Parameters
The parameters controlling motion detection are described in the table below:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Object Size</th>
<th>History</th>
<th>Sensitivity</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>

AXIS M1033-W Network Camera

Detectors

Note

- To trigger on small objects or movements, use several small motion detection windows rather than one large window and select a low object size.
- To avoid triggering on small objects, select a high object size.
- While monitoring an area where moving objects are not expected, select a high history level. This will cause motion detection to trigger as long as the object is present in the window.
- To only detect flashing light, select a low sensitivity. In other cases high sensitivity is recommended.

Audio Detection

The Axis product can be configured to generate an alarm when audio rises above or falls below the threshold value. The threshold value can be set in the range 0–100 where 0 is the most sensitive and 100 the least sensitive.

1. Go to Detectors > Audio Detection.
2. Set the audio alarm level and click Save.
3. Go to Events > Action Rules and set up an action rule, see Set Up Action Rules on page 35.

Detected audio is indicated by colored peaks in the Activity indicator. An event is triggered when detected audio rises above or falls below the threshold value, which is represented by the bar.

PIR Sensor

The PIR (Passive Infrared) sensor detects motion by measuring changes in infrared light. The sensor can for example be used in low-light environments where video motion detection (see page 32) is not reliable.

To adjust the sensitivity of the PIR sensor, an action rule that activates the built-in light when the PIR sensor detects motion is useful:

1. Go to Events > Action Rules and click Add.
2. Select Detectors from the Trigger list and then select PIR.
3. Select Activate Light as the action.
4. Click OK to save the rule.
5. Go to Detectors > PIR Sensor.
6. Make sure there is movement in front of the camera and adjust the Sensitivity until the light is activated.
7. When satisfied, click Save.

By setting up action rules, the Axis product can be configured to, for example, record video when the PIR sensor detects motion. If the camera is used in a low-light environment, an action rule that turns on the built-in light can improve image quality of the recorded video.

For more information on action rules, see Events on page 35.
AXIS M1033-W Network Camera

Events

The Event pages allow you to configure the Axis product to perform actions when different events occur. For example, the product can start a recording or send an email notification when motion is detected. The set of conditions that defines how and when the action is triggered is called an action rule.

Convert Event Types to Action Rules

If the Axis product is upgraded to firmware version 5.40 or later, it is recommended to convert Event Types to Action Rules. The legacy user Event Types in the camera will continue to work but will not be visible in the user interface of the camera. The Event Types need to be converted to Action rules to become visible in the user interface.

To convert Event Types to Action Rules go to Events > Action Rules and click Convert.

This is not recommended when using a VMS based on the old Event Management System.

Set Up Action Rules

An action rule defines the conditions that must be met for the product to perform an action, for example record video or send an email notification. If multiple conditions are defined, all of them must be met to trigger the action.

For more information about available triggers and actions, see Triggers on page 36 and Actions on page 37.

The following example describes how to set up an action rule to record video to a network share if there is movement in the camera’s field of view.

Set up motion detection and add a network share:

1. Go to Detectors > Motion Detection and configure a motion detection window. See page 33
2. Go to System Options > Storage and set up the network share. See page 56.

Set up the action rule:

1. Go to Events > Action Rules and click Add.
2. Select Enable rule and enter a descriptive name for the rule.
3. Select Detectors from the Trigger drop-down list.
4. Select Motion Detection from the drop-down list. Select the motion detection window to use.
5. Optionally, select a Schedule and Additional conditions. See below.
6. Under Actions, select Record Video from the Type drop-down list.
7. Select a Stream profile and configure the Duration settings as described below.
8. Select Network Share from the Storage drop-down list.

To use more than one trigger for the action rule, select Additional conditions and click Add to add additional triggers. When using additional conditions, all conditions must be met to trigger the action.

To prevent an action from being triggered repeatedly, a Wait at least time can be set. Enter the time in hours, minutes and seconds, during which the trigger should be ignored before the action rule can be activated again.

The recording Duration of some actions can be set to include time immediately before and after the event. Select Pre-trigger time and/or Post-trigger time and enter the number of seconds. When While the rule is active is enabled and the action is triggered again during the post-trigger time, the recording time will be extended with another post-trigger time period.
# AXIS M1033-W Network Camera

## Events

For more information, see the online help.

### Triggers

Available action rule triggers and conditions include:

- **Detectors**
  - Audio Detection – Trigger the rule when audio is detected. See *Audio Detection* on page 34.
  - Live Stream Accessed – Trigger the rule when any stream is accessed and during edge storage playback. This can for example be used to send notifications.
  - Motion Detection – Trigger the rule when motion is detected. See *Motion Detection* on page 32.
  - PIR – Trigger the rule when the PIR sensor detects motion. See *PIR Sensor* on page 34.
  - Tampering – Trigger the rule when tampering is detected. See *Camera Tampering* on page 32.

- **Hardware**
  - Network – Trigger the rule if network connection is lost or restored.

- **Input Signal**
  - Digital Input Port – Trigger the rule when an I/O port receives a signal from a connected device. See *I/O Ports* on page 56.
  - Manual Trigger – Trigger the rule using the Manual Trigger button in the Live View page. See *Controls on the Live View Page* on page 13. This can for example be used to validate actions during product installation and configuration.
  - Virtual Inputs – can be used by a VMS (Video Management System) to trigger actions. Virtual inputs can, for example, be connected to buttons in the VMS user interface.

- **PTZ**
  - Error – Trigger the rule if the PTZ functionality is not working correctly. This can for example be used to send maintenance notifications.
  - Moving – Trigger the rule when the camera view moves due to a PTZ operation. This can for example be used as an additional condition to prevent an action rule triggered by motion detection to record video while the camera view moves due to a PTZ operation.
  - Preset Reached – Trigger the rule when the camera stops at a preset position. This can be for example be used with the Send Images action to upload images from the preset position.

- **Storage**
  - Available – Trigger the rule when the storage device is unmounted or removed. This can for example be used to send maintenance notifications.
  - Disruption – Trigger the rule if storage problems are detected, for example if the storage device is unavailable, removed, full, locked or if other read or write problems occur. This can for example be used to send maintenance notifications.
  - Full – Trigger the rule when the storage device is full. Under normal operation, the oldest recordings will be overwritten to prevent the storage device from becoming full.
  - Locked – Trigger the rule if the storage device is locked (write protected).

- **System**
AXIS M1033-W Network Camera

Events

- System Ready – Trigger the rule when the product has been started and all services are running. This can for example be used to send a notification when the product restarts.
- Time
  - Recurrence – Trigger the rule periodically. See Set Up Recurrences on page 39. This can for example be used to upload an image every 5 minutes.
  - Use Schedule – Trigger the rule according to the selected schedule. See Create Schedules on page 39.

Actions

Available actions include:

- Activate Light – Turn the built-in light on or off.
- Output Port – Activate an I/O port to control an external device.
- Overlay Text – Display an overlay text. See Use Overlay Text in an Action Rule on page 24.
- PTZ Control
  - Preset Position – Go to a preset position.
  - Guard Tour – Start a guard tour. See Guard Tour on page 29.
- Record Video – Record video and audio to a selected storage. To record audio, use AAC audio encoding and make sure that audio is enabled in the selected stream profile.
- Send Images – Send images to a recipient.
- Send Notification – Send a notification message to a recipient.
- Send Video Clip – Send a video clip to a recipient.
- Status LED – Flash the LED indicator. This can for example be used to validate triggers such as motion detection during product installation and configuration.

Add Recipients

The product can send media files and messages to notify users about events. Before the product can send media files or notification messages, you must define one or more recipients. For information about available options, see Recipient Types on page 37.

To add a recipient:

1. Go to Events > Recipients and click Add.
2. Enter a descriptive name.
3. Select a recipient Type.
4. Enter the information needed for the recipient type.
5. Click Test to test the connection to the recipient.
6. Click OK.

Recipient Types

The following recipients are available:

### Set Up Email Recipients

Email recipients can be configured by selecting one of the listed email providers, or by specifying the SMTP server, port and authentication used by, for example, a corporate email server.

**Note**

Some email providers have security filters that prevent users from receiving or viewing large amount of attachments, from receiving scheduled emails and similar. Check the email provider's security policy to avoid delivery problems and locked email accounts.

To set up an email recipient using one of the listed providers:

1. Go to Events > Recipients and click Add.
2. Enter a Name and select Email from the Type list.
3. Enter the email addresses to send emails to in the To field. Use commas to separate multiple addresses.
4. Select the email provider from the Provider list.
5. Enter the user ID and password for the email account.
6. Click Test to send a test email.

To set up an email recipient using for example a corporate email server, follow the instructions above but select User defined as Provider. Enter the email address to appear as sender in the From field. Select Advanced settings and specify the SMTP server address, port and authentication method. Optionally, select Use encryption to send emails over an encrypted connection. The server certificate can be validated using the certificates available in the Axis product. For information on how to upload certificates, see Certificates on page 44.
Events

Create Schedules
Schedules can be used as action rule triggers or as additional conditions, for example to record video if motion is detected outside office hours. Use one of the predefined schedules or create a new schedule as described below.

To create a new schedule:
1. Go to Events > Schedules and click Add.
2. Enter a descriptive name and the information needed for a daily, weekly, monthly or yearly schedule.
3. Click OK.

To use the schedule in an action rule, select the schedule from the Schedule drop-down list in the Action Rule Setup page.

Set Up Recurrences
Recurrences are used to trigger action rules repeatedly, for example every 5 minutes or every hour.

To set up a recurrence:
1. Go to Events > Recurrences and click Add.
2. Enter a descriptive name and recurrence pattern.
3. Click OK.

To use the recurrence in an action rule, first select Time from the Trigger drop-down list in the Action Rule Setup page and then select the recurrence from the second drop-down list.

To modify or remove recurrences, select the recurrence in the Recurrences List and click Modify or Remove.
AXIS M1033-W Network Camera

Recordings

Recordings

The Axis product can be configured to record video continuously or according to an action rule:

- To start a continuous recording, see page 40.
- To set up action rules, see page 35.
- To access recordings, see Recording List on page 40.
- To configure camera controlled storage, see Storage on page 54.

Recording List

Recorded videos are listed on the Recordings > List page. The list shows each recording's start date and time, duration and the event that triggered the recording.

To play or download a recording, follow these steps:

1. Go to Recordings > List.
2. Use the filter to narrow the list of recordings. Enter the desired filter criteria and click Filter. Some filters may take a long time to complete.
3. Select the recording.
4. Click Play to play the recording, or click Download to download the recording.

Multiple recordings can be downloaded at the same time. Select the recordings and click Download. The downloaded file is a zip file containing a minimum of three files, of which the Matroska (mkv) files are the actual recordings. The recordings are time-stamped with the date and time they were downloaded (that is, not the date the recordings were made).

**Note**

To play recordings in Windows Media Player, AXIS Matroska File Splitter must be installed. AXIS Matroska File Splitter can be downloaded from www.axis.com/techsup/software

For detailed recording and video information, select a recording and click Properties.

To remove a recording, select the recording and click Remove.

Continuous Recording

The Axis product can be configured to continuously save video to a storage device. For information about storage devices, see Storage on page 54. To prevent the disk from becoming full, it is recommended to configure the disk to automatically remove old recordings.

If a new stream profile is selected while a recording is ongoing, the recording will be stopped and saved in the recording list and a new recording with the new stream profile will start. All previous continuous recordings will remain in the recording list until they are removed manually or through automatic removal of old recordings.

To start a continuous recording, follow these steps:

1. Go to Recordings > Continuous.
2. Select Enabled.
3. Select the type of storage device from the Storage list.
4. Select a Stream profile to use for continuous recordings. To include audio in the recording, use AAC audio encoding and make sure that audio is enabled in the selected stream profile.
AXIS M1033-W Network Camera

Recordings

5. Click Save to save and start the recording.
AXIS M1033-W Network Camera

Languages

Languages

Multiple languages can be installed in the Axis product. All web pages including the online help will be displayed in the selected language. To switch languages, go to Setup > Languages and first upload the new language file. Browse and locate the file and click the Upload Language button. Select the new language from the list and click Save.

Note

- Resetting the product to factory default settings will erase any uploaded language files and reset the product language to English.
- Clicking the Restore button on the Maintenance page will not affect the language.
- A firmware upgrade will not affect the language used. However if you have uploaded a new language to the product and later upgrade the firmware, it may happen that the translation no longer matches the product’s web pages. In this case, upload an updated language file.
- A language already installed in the product will be replaced when a current or a later version of the language file is uploaded.
**AXIS M1033-W Network Camera**

**System Options**

**Security**

**Users**

User access control is enabled by default and can be configured under System Options > Security > Users. An administrator can set up other users by giving them user names and passwords. It is also possible to allow anonymous viewer login, which means that anybody may access the Live View page.

The user list displays authorized users and user groups (access levels):

- **Viewer** – Access to the Live View page
- **Operator** – Access to the Live View page and to all settings except System Options
- **Administrator** – Unrestricted access to all settings; can add, modify and remove other users.

Under HTTP/RTSP Password Settings, select the type of password to allow. You may need to allow unencrypted passwords if there are viewing clients that do not support encryption, or if you upgraded the firmware and existing clients support encryption but need to log in again and be configured to use this functionality.

Under User Settings, select the Enable anonymous viewer login option to allow anonymous users access to the Live View page.

Select the Enable anonymous PTZ control login to allow anonymous users access to the PTZ controls.

Deselect the Enable Basic Setup option to hide the Basic Setup menu. Basic Setup provides quick access to settings that should be made before using the Axis product.

**ONVIF**

ONVIF (Open Network Video Interface Forum) is a global interface standard that makes it easier for end users, integrators, consultants, and manufacturers to take advantage of the possibilities offered by network video technology. ONVIF enables interoperability between different vendor products, increased flexibility, reduced cost and future-proof systems.

By creating a user you automatically enable ONVIF communication. Use the user name and password with all ONVIF communication with the product. For more information see www.onvif.org

**IP Address Filter**

IP address filtering is enabled on the System Options > Security > IP Address Filter page. Once enabled, the listed IP address are allowed or denied access to the Axis product. Select Allow or Deny from the list and click Apply to enable IP address filtering.

The administrator can add up to 256 IP address entries to the list (a single entry can contain multiple IP addresses).

**HTTPS**

HTTPS (HyperText Transfer Protocol over Secure Socket Layer, or HTTP over SSL) is a web protocol providing encrypted browsing. HTTPS can also be used by users and clients to verify that the correct device is being accessed. The security level provided by HTTPS is considered adequate for most commercial exchanges.

The Axis product can be configured to require HTTPS when users from different user groups (administrator, operator, viewer) log in.

To use HTTPS, an HTTPS certificate must first be installed. Go to System Options > Security > Certificates to install and manage certificates. See Certificates on page 44.

To enable HTTPS on the Axis product:

1. Go to System Options > Security > HTTPS
AXIS M1033-W Network Camera

System Options

2. Select an HTTPS certificate from the list of installed certificates.
3. Optionally, click Ciphers and select the encryption algorithms to use for SSL.
4. Set the HTTPS Connection Policy for the different user groups.
5. Click Save to enable the settings.

To access the Axis product via the desired protocol, in the address field in a browser, enter https:// for the HTTPS protocol and http:// for the HTTP protocol.

The HTTPS port can be changed on the System Options > Network > TCP/IP > Advanced page.

IEEE 802.1X

IEEE 802.1X is a standard for port-based Network Admission Control providing secure authentication of wired and wireless network devices. IEEE 802.1X is based on EAP (Extensible Authentication Protocol).

To access a network protected by IEEE 802.1X, devices must be authenticated. The authentication is performed by an authentication server, typically a RADIUS server, examples of which are FreeRADIUS and Microsoft Internet Authentication Service.

In Axis implementation, the Axis product and the authentication server identify themselves with digital certificates using EAP-TLS (Extensible Authentication Protocol - Transport Layer Security). The certificates are provided by a Certification Authority (CA). You need:

- a CA certificate to authenticate the authentication server.
- a CA-signed client certificate to authenticate the Axis product.

To create and install certificates, go to System Options > Security > Certificates. See Certificates on page 44. Many CA certificates are preinstalled.

To allow the product to access a network protected by IEEE 802.1X:

1. Go to System Options > Security > IEEE 802.1X.
2. Select a CA Certificate and a Client Certificate from the lists of installed certificates.
3. Under Settings, select the EAPOL version and provide the EAP identity associated with the client certificate.
4. Check the box to enable IEEE 802.1X and click Save.

**Note**

For authentication to work properly, the date and time settings in the Axis product should be synchronized with an NTP server. See Date & Time on page 45.

Certificates

Certificates are used to authenticate devices on a network. Typical applications include encrypted web browsing (HTTPS), network protection via IEEE 802.1X and secure upload of images and notification messages for example via email. Two types of certificates can be used with the Axis product:

Server/Client certificates - To authenticate the Axis product.

CA certificates - To authenticate peer certificates, for example the certificate of an authentication server in case the Axis product is connected to an IEEE 802.1X protected network.

**Note**

Installed certificates, except preinstalled CA certificates, will be deleted if the product is reset to factory default. Preinstalled CA certificates that have been deleted will be reinstalled.
AXIS M1033-W Network Camera

System Options

A Server/Client certificate can be self-signed or issued by a Certificate Authority (CA). A self-signed certificate offers limited protection and can be used before a CA-issued certificate has been obtained.

To install a self-signed certificate:
1. Go to Setup > System Options > Security > Certificates.
2. Click Create self-signed certificate and provide the requested information.

To create and install a CA-signed certificate:
1. Create a self-signed certificate as described above.
2. Go to Setup > System Options > Security > Certificates.
3. Click Create certificate signing request and provide the requested information.
4. Copy the PEM-formatted request and send to the CA of your choice.
5. When the signed certificate is returned, click Install certificate and upload the certificate.

Server/Client certificates can be installed as Certificate from signing request or as Certificate and private key. Select Certificate and private key if the private key is to be upload as a separate file or if the certificate is in PKCS#12 format.

The Axis product is shipped with several preinstalled CA certificates. If required, additional CA certificates can be installed:
1. Go to Setup > System Options > Security > Certificates.
2. Click Install certificate and upload the certificate.

Audio Support

Select Enable audio support to allow clients to retrieve audio streams from the Axis product. For information on how to configure audio settings, see Set Up Audio on page 25.

**Note**

Deselecting this option will disable audio globally in the Axis product, for configured events and profiles with audio as well.

Date & Time

The Axis product’s date and time settings are configured under System Options > Date & Time.

Current Server Time displays the current date and time (24h clock). The time can be displayed in 12h clock in the text overlay (see below).

To change the date and time settings, select the preferred Time mode under New Server Time:

- **Synchronize with computer time** – Sets date and time according to the computer’s clock. With this option, date and time are set once and will not be updated automatically.
- **Synchronize with NTP Server** – Obtains date and time from an NTP server. With this option, date and time settings are updated continuously. For information on NTP settings, see NTP Configuration on page 48.
  
  If using a host name for the NTP server, a DNS server must be configured. See DNS Configuration on page 48.
- **Set manually** – Allows you to manually set date and time.

If using an NTP server, select your Time zone from the drop-down list. If required, check Automatically adjust for daylight saving time changes.

The Date & Time Format Used in Images is the date and time format displayed as a text overlay in the video stream. Use the predefined formats or see File Naming & Date/Time Formats in the online help for information on how to create custom date and time formats. To include date and time in the overlay text, go to Video & Audio and select Include date and Include time.
AXIS M1033-W Network Camera

System Options

Network

Basic TCP/IP Settings
The Axis product supports IP version 4 and IP version 6. Both versions can be enabled simultaneously, and at least one version must always be enabled.

Network Interface Mode
The network interface to the AXIS product can be wired or wireless. Different settings can be used for each network interface, but only one can be used at a time. In Auto mode the product will use a wireless network unless a network cable is connected, in which case it will use the wired network. In Wired mode the product will require a network cable to connect to the network.

IPv4 Address Configuration
By default, the Axis product is set to use IPv4 (IP version 4) and to obtain the IP address automatically via DHCP. The IPv4 settings are configured under System Options > Network > TCP/IP > Basic.

DHCP (Dynamic Host Configuration Protocol) allows network administrators to centrally manage and automate the assignment of IP addresses. DHCP should only be enabled if using dynamic IP address notification, or if the DHCP can update a DNS server. It is then possible to access the Axis product by name (host name).

If DHCP is enabled and the product cannot be accessed, run AXIS IP Utility to search the network for connected Axis products, or reset the product to the factory default settings (see page 58) and then perform the installation again.

To use a static IP address, check Use the following IP address and specify the IP address, subnet mask and default router.

IPv6 Address Configuration
If IPv6 (IP version 6) is enabled, the Axis product will receive an IP address according to the configuration in the network router.

To enable IPv6, go to System Options > Network > TCP/IP > Basic. Other settings for IPv6 should be configured in the network router.

ARP/Ping
The product's IP address can be assigned using ARP and Ping. For instructions, see Assign IP Address Using ARP/Ping on page 46.

The ARP/Ping service is enabled by default but is automatically disabled two minutes after the product is started, or as soon as an IP address is assigned. To re-assign IP address using ARP/Ping, the product must be restarted to enable ARP/Ping for an additional two minutes.

To disable the service, go to System Options > Network > TCP/IP > Basic and clear the option Enable ARP/Ping setting of IP address.

Pinging the product is still possible when the service is disabled.

Assign IP Address Using ARP/Ping
The product's IP address can be assigned using ARP/Ping. The command must be issued within 2 minutes of connecting power.

1. Acquire a free static IP address on the same network segment as the computer.
2. Locate the serial number (S/N) on the product label.
3. Open a command prompt and enter the following commands:
   Linux/Unix syntax
   
   ```
   arp -s <IP address> <serial number> temp
   ping -s 408 <IP address>
   ```
   
   Linux/Unix example

AXIS M1033-W Network Camera

System Options

arp -s 192.168.0.125 00:40:8c:18:10:00 temp
ping -s 408 192.168.0.125

Windows syntax (this may require that you run the command prompt as an administrator)

arp -s <IP address> <serial number>
ping -l 408 -t <IP address>

Windows example (this may require that you run the command prompt as an administrator)

arp -s 192.168.0.125 00-40-8c-18-10-00
ping -l 408 -t 192.168.0.125

4. Check that the network cable is connected and then restart the product by disconnecting and reconnecting power.

5. Close the command prompt when the product responds with Reply from 192.168.0.125:... or similar.

6. Open a browser and type http://<IP address> in the Location/Address field.

For other methods of assigning the IP address, see the Installation and Management Software CD or the document Assign an IP Address and Access the Video Stream on Axis Support web at www.axis.com/techsup

Note

- To open a command prompt in Windows, open the Start menu and type cmd in the Run/Search field.
- To use the ARP command in Windows 8/Windows 7/Windows Vista, right-click the command prompt icon and select Run as administrator.
- To open a command prompt in Mac OS X, open the Terminal utility from Application > Utilities.

AXIS Video Hosting System (AVHS)

AVHS used in conjunction with an AVHS service, provides easy and secure Internet access to live and recorded video accessible from any location. For more information and help to find a local AVHS Service Provider go to www.axis.com/hosting

The AVHS settings are configured under System Options > Network > TCP IP > Basic. The possibility to connect to an AVHS service is enabled by default. To disable, clear the Enable AVHS box.

One-click enabled – Press and hold the product’s control button (see Hardware Overview on page 8) for about 3 seconds to connect to an AVHS service over the Internet. Once registered, Always will be enabled and the Axis product stays connected to the AVHS service. If the product is not registered within 24 hours from when the button is pressed, the product will disconnect from the AVHS service.

Always – The Axis product will constantly attempt to connect to the AVHS service over the Internet. Once registered the product will stay connected to the service. This option can be used when the product is already installed and it is not convenient to use the one-click installation.

AXIS Internet Dynamic DNS Service

AXIS Internet Dynamic DNS Service assigns a host name for easy access to the product. For more information, see www.axiscam.net

To register the Axis product with AXIS Internet Dynamic DNS Service, go to System Options > Network > TCP/IP > Basic. Under Services, click the AXIS Internet Dynamic DNS Service Settings button (requires access to the Internet). The domain name currently registered at AXIS Internet Dynamic DNS service for the product can at any time be removed.

Note

AXIS Internet Dynamic DNS Service requires IPv4.
Advanced TCP/IP Settings

DNS Configuration
DNS (Domain Name Service) provides the translation of host names to IP addresses. The DNS settings are configured under System Options > Network > TCP/IP > Advanced.

Select Obtain DNS server address via DHCP to use the DNS settings provided by the DHCP server.

To make manual settings, select Use the following DNS server address and specify the following:

Domain name – Enter the domain(s) to search for the host name used by the Axis product. Multiple domains can be separated by semicolons. The host name is always the first part of a fully qualified domain name, for example, myserver is the host name in the fully qualified domain name myserver.mycompany.com where mycompany.com is the domain name.

Primary/Secondary DNS server – Enter the IP addresses of the primary and secondary DNS servers. The secondary DNS server is optional and will be used if the primary is unavailable.

NTP Configuration
NTP (Network Time Protocol) is used to synchronize the clock times of devices in a network. The NTP settings are configured under System Options > Network > TCP/IP > Advanced.

Select Obtain NTP server address via DHCP to use the NTP settings provided by the DHCP server.

To make manual settings, select Use the following NTP server address and enter the host name or IP address of the NTP server.

Host Name Configuration
The Axis product can be accessed using a host name instead of an IP address. The host name is usually the same as the assigned DNS name. The host name is configured under System Options > Network > TCP/IP > Advanced.

Select Obtain host name via IPv4 DHCP to use host name provided by the DHCP server running on IPv4.

Select Use the host name to set the host name manually.

Select Enable dynamic DNS updates to dynamically update local DNS servers whenever the Axis product’s IP address changes.

For more information, see the online help.

Link-Local IPv4 Address
Link-Local Address is enabled by default and assigns the Axis product an additional IP address which can be used to access the product from other hosts on the same segment on the local network. The product can have a Link-Local IP and a static or DHCP-supplied IP address at the same time.

This function can be disabled under System Options > Network > TCP/IP > Advanced.

HTTP
The HTTP port used by the Axis product can be changed under System Options > Network > TCP/IP > Advanced. In addition to the default setting, which is 80, any port in the range 1024-65535 can be used.

HTTPS
The HTTPS port used by the Axis product can be changed under System Options > Network > TCP/IP > Advanced. In addition to the default setting, which is 443, any port in the range 1024-65535 can be used.

To enable HTTPS, go to System Options > Security > HTTPS. For more information, see HTTPS on page 43.
AXIS M1033-W Network Camera

System Options

NAT traversal (port mapping) for IPv4

A network router allows devices on a private network (LAN) to share a single connection to the Internet. This is done by forwarding network traffic from the private network to the "outside", that is, the Internet. Security on the private network (LAN) is increased since most routers are pre-configured to stop attempts to access the private network (LAN) from the public network (Internet).

Use NAT traversal when the Axis product is located on an intranet (LAN) and you wish to make it available from the other (WAN) side of a NAT router. With NAT traversal properly configured, all HTTP traffic to an external HTTP port in the NAT router is forwarded to the product.

NAT traversal is configured under System Options > Network > TCP/IP > Advanced.

Note
• For NAT traversal to work, this must be supported by the router. The router must also support UPnP®.
• In this context, router refers to any network routing device such as a NAT router, Network router, Internet Gateway, Broadband router, Broadband sharing device, or a software such as a firewall.

Enable/Disable – When enabled, the Axis product attempts to configure port mapping in a NAT router on your network, using UPnP®. Note that UPnP® must be enabled in the product (see System Options > Network > UPnP).

Use manually selected NAT router – Select this option to manually select a NAT router and enter the IP address for the router in the field. If no router is specified, the product automatically searches for NAT routers on your network. If more than one router is found, the default router is selected.

Alternative HTTP port – Select this option to manually define an external HTTP port. Enter a port in the range 1024–65535. If the port field is empty or contains the default setting, which is 0, a port number is automatically selected when enabling NAT traversal.

Note
• An alternative HTTP port can be used or be active even if NAT traversal is disabled. This is useful if your NAT router does not support UPnP and you need to manually configure port forwarding in the NAT router.
• If you attempt to manually enter a port that is already in use, another available port is automatically selected.
• When the port is selected automatically it is displayed in this field. To change this, enter a new port number and click Save.

FTP

The FTP server running in the Axis product enables upload of new firmware, user applications, etc. The FTP server can be disabled under System Options > Network > TCP/IP > Advanced.

Note
This FTP server has nothing to do with the product’s ability to transfer images via FTP to other locations and servers.

RTSP

The RTSP server running in the Axis product allows a connecting client to start an H.264 stream. The RTSP port number can be changed under System Options > Network > TCP/IP > Advanced. The default port is 554.

Note
H.264 video streams will not be available if the RTSP server is disabled.

Wireless

Wireless Network Status

To view a list of available wireless networks, go to System Options > Network > Wireless. The status of wireless networks list is the result of a network scan and provides the following information:

• SSID is the name of a wireless network (or ad-hoc network).
AXIS M1033-W Network Camera

System Options

- **Mode** shows the type of network, which can be Master (an access point) or Ad-Hoc.
- **Security** shows the type of security the network uses.
- **Channel** shows the wireless channel currently in use.
- **Signal strength** shows the quality, the strength, of the signal.
- **Bit rate** shows the current bit rate in Mbit/s. This can only be shown for the access point currently in use.

Click **Refresh** to perform a new scan.

Access points with a disabled SSID Broadcast will not appear unless the Axis product is associated with it. Once the wireless connection is established, the network the Axis product is currently linked to is shown in blue. A network using unsupported security is shown in grey.

**Wireless Settings**

**Important**

- To establish and maintain communication, all wireless settings must be exactly the same in the Axis product as in the access point or ad-hoc network.
- Always configure or change the wireless settings in the Axis product first, before changing the settings in the wireless access point.
- Keys, passphrases and certificates that are used for security must be entered manually. Contact your Network Administrator for the requirements for the selected access point or ad-hoc network.

The wireless settings control how the Axis product interacts with the wireless network. Apart from identifying the wireless network, it is also possible to enable wireless encryption.

Select **Enable congestion control** to secure the wireless connection between the Axis product and access point in congested environments, for example where there are many available networks and where many devices are using the same access point.

Congestion control uses a Request To Send/Clear To Send (RTS/CTS) handshake to reserve access to the wireless media before transmitting a packet. Using the handshake decreases throughput since it adds an overhead. In some situations, however, the overhead of the RTS/CTS handshake is lower than the overhead caused by collisions on the wireless media. Congestion control is disabled by default.

Select **Enable WLAN pairing button** to allow the wireless Axis product to connect to an access point by pushing a button on both of the devices within a 120 second time window. During this time the devices will automatically discover each other and agree on a configuration.

Make sure the access point also has push button configuration (PBC) enabled and that the Axis product is not connected to the wired network. After a successful pairing any WLAN settings set by the user in the Axis product are overwritten. The WLAN pairing button is enabled by default; deselect this option to prevent unauthorized WLAN pairing.

**SSID** is the name of the selected wireless network, which must be exactly the same as the name in the wireless access point. If the field is left blank the Axis product will not connect to any wireless network.

**Note**

SSID is sometimes written as ESSID.

Select the network **Security method**. All settings must match the settings in the access point. The following security methods are supported, where WPA™-WPA2™-Enterprise is more secure than WPA-/WPA2-PSK, which in turn is more secure than WEP:

- **WPA-/WPA2-PSK.** See page 51.
- **WPA-/WPA-Enterprise.** See page 51.
- **WEP (not recommended).** See page 52.
- **No security (not recommended).** See page 52.
If applicable, select the **Network type**. Select **Master** to access the network via an access point or **Ad-hoc** to access any other wireless device and create a local network.

Ad-hoc mode allows users to form a wireless LAN without connection through an access point. The Axis product can, for example, connect point-to-point to an existing ad-hoc network, or if there is none, create one itself. Ad-hoc connection may be useful in certain installations and for troubleshooting but is not the recommended method. The ad-hoc option is only available when supported by the selected security method.

**WPA™-/WPA2™-PSK**

The security method WPA-/WPA2–PSK is designed for small networks and does not require an authentication server. The Axis product uses a PSK (Pre-Shared Key) to authenticate with the access point. The key can be entered either as manual hex — a 64 hexadecimal number (0–9, A–F) — or a passphrase using 8–63 ASCII characters. The longer the passphrase, the more secure is the key.

To configure the wireless settings using the WPA-/WPA2–PSK security method:

1. Enter the required **Passphrase** for the access point.
2. Click **Save**.

**WPA™-/WPA–Enterprise**

The security method WPA-/WPA–Enterprise is designed for large networks and requires an authentication server. The network is protected by EAPOL (Extensible Authentication Protocol Over Lan).

Select the **WPA–Enterprise type** being used by the access point:

- **EAP-TLS**. See page 51.
- **EAP-PEAP/MSCHAPv2**. See page 51.

**EAP-TLS**

The authentication protocol **EAP-TLS** (Extensible Authentication Protocol - Transport Layer Security) allows the client and server to authenticate each other using digital certificates provided by a Certification Authority. To gain access to the protected network, the Axis product presents its certificate to the network access point. Access is granted if the certificate is approved.

**Important**

To ensure successful certificate validation, time synchronization should be performed on all clients and servers prior to configuration.

To configure the wireless settings using the WPA™-/WPA–Enterprise security method and EAP-TLS:

1. Enter the user **Identity** associated with your certificate.
2. Enter the **Private key password** for your user identity.
3. Select the **EAPOL version** (1 or 2) as used in the access point.
4. Click **Save**.

For more information on certificates for wireless networks, see **Certificates** on page 52.

**EAP-PEAP/MSCHAPv2**

The authentication protocol **EAP-PEAP/MSCHAPv2** (Extensible Authentication Protocol - Protected Extensible Authentication Protocol/Microsoft Challenge Handshake Authentication Protocol) allows the client to authenticate the network using a digital certificate provided by a Certification Authority. The network authenticates the client using an identity and a password. To gain access to the protected network, the Axis product presents its identity and password to the network access point. If these credentials are approved, the access point allows access on a preconfigured port.
AXIS M1033-W Network Camera

System Options

Important
To ensure successful certificate validation, time synchronization should be performed on all clients and servers prior to configuration.

To configure the wireless settings using the WPA™-WPA-Enterprise security method and EAP-PEAP/MSCHAPv2:
1. Enter the user Identity associated with your certificate.
2. Enter the Password for your user identity.
3. Select the PEAP Version (0 or 1) as used in the access point.
4. Select the PEAP Label that the access point uses when using PEAP version 1. Select 1 to use client EAP encryption; select 2 to use client PEAP encryption.
5. Select the EAPOL version (1 or 2) as used in the access point.
6. Click Save.

For more information on certificates for wireless networks, see Certificates on page 52.

WEP
The security method WEP (Wired Equivalent Privacy) can be used to help secure a wireless network. However, WEP has some flaws, which makes it more vulnerable to attacks and WPA™–WPA-Enterprise or WPA2™–PSK is a better choice.

To configure the wireless settings using the WEP security method:
1. Select the network type being used by the access point, Master or Ad-Hoc.
2. Select the Authentication type, Open or Shared Key depending on the method used by the access point. Not all access points have this option, in which case they probably use open system, also sometimes called SSID Authentication.
3. Select the Key length, 64 bit or 128 bit used for the wireless encryption.
4. Select the Key type, depending on the key type used by the access point and enter the key in the corresponding key fields.
   Manual allows you to manually enter the hex key. ASCII requires the string to be exactly five characters for 64-bit WEP and 13 characters for 128-bit WEP. The Passphrase can contain up to 31 characters. In 64-bit WEP the passphrase generates four different keys. For 128-bit WEP, only one key is generated, which then is replicated for all four keys.
   The Active transmit key selects which of the four keys the Axis product uses when transmitting information.
5. Click Save.

No Security
The No security option provides no protection against attacks. It is not a recommended method and should only be used during short periods and exceptional cases.

To configure the wireless settings with no security:
1. Select the network type being used by the access point, Master or Ad-Hoc.
2. Click Save.

Certificates
Wireless network certificates are used to authenticate devices on a wireless network. Wireless networks using the WPA™–WPA-Enterprise security method are protected by EAPOL (Extensible Authentication Protocol Over Lan), which is part of the IEEE 802.1X standard. The client and server authenticate each other using digital certificates provided by a Certificate Authority. To
AXIS M1033-W Network Camera

System Options

gain access to the protected wireless network, the Axis product presents its certificate to the network switch. If the certificate is approved, the switch allows access.

You may need to contact your network administrator for information on certificates, user IDs and passwords

CA certificate – Created by the Certification Authority for the purpose of validating itself and is used by the Axis product for checking the server’s identity.

Client certificate/Certificate private key – Used for the Axis product to authenticate itself using a client certificate and a private key.

To upload a CA certificate:

1. Enter the path to the certificate directly or click Browse to locate the file.
2. Click Upload.

To upload a certificate/client private key:

1. Use the Certificate private key field if uploading one combined file. For each file, enter the path to the file or click Browse to locate the file.
2. Click Upload.

To remove a CA certificate/Certificate certificate/Certificate private key, click Remove.

Note

Installed certificates will be deleted if the product is reset to factory default.

For more information about IEEE 802.1X, see IEEE 802.1X on page 44.

SOCKS

SOCKS is a networking proxy protocol. The Axis product can be configured to use a SOCKS server to reach networks on the other side of a firewall or proxy server. This functionality is useful if the Axis product is located on a local network behind a firewall, and notifications, uploads, alarms, etc need to be sent to a destination outside the local network (for example the Internet).

SOCKS is configured under System Options > Network > SOCKS. For more information, see the online help.

QoS (Quality of Service)

QoS (Quality of Service) guarantees a certain level of a specified resource to selected traffic on a network. A QoS-aware network prioritizes network traffic and provides a greater network reliability by controlling the amount of bandwidth an application may use.

The QoS settings are configured under System Options > Network > QoS. Using DSCP (Differentiated Services Codepoint) values, the Axis product can mark different types of traffic.

Note

Live audio DSCP will be equal to live video DSCP if H.264 over RTSP is used.

SNMP

The Simple Network Management Protocol (SNMP) allows remote management of network devices. An SNMP community is the group of devices and management station running SNMP. Community names are used to identify groups.

To enable and configure SNMP in the Axis product, go to the System Options > Network > SNMP page.

Depending on the level of security required, select the version on SNMP to use.

Traps are used by the Axis product to send messages to a management system on important events and status changes. Check Enable traps and enter the IP address where the trap message should be sent and the Trap community that should receive the message.
AXIS M1033-W Network Camera

System Options

Note
If HTTPS is enabled, SNMP v1 and SNMP v2c should be disabled.

Traps for SNMP v1/v2 are used by the Axis product to send messages to a management system on important events and status changes. Check Enable traps and enter the IP address where the trap message should be sent and the Trap community that should receive the message.

The following traps are available:
- Cold start
- Warm start
- Link up
- Authentication failed

SNMP v3 provides encryption and secure passwords. To use traps with SNMP v3, an SNMP v3 management application is required.

To use SNMP v3, HTTPS must be enabled, see HTTPS on page 43. To enable SNMP v3, check the box and provide the initial user password.

Note
The initial password can only be set once. If the password is lost, the Axis product must be reset to factory default, see Reset to Factory Default Settings on page 58.

UPnP™
The Axis product includes support for UPnP™. UPnP™ is enabled by default and the product is automatically detected by operating systems and clients that support this protocol.

UPnP™ can be disabled under System Options > Network > UPnP

RTP/H.264
The RTP port range and multicast settings are configured under System Options > Network > RTP.

The RTP port range defines the range of ports from which the video/audio ports are automatically selected. For multicast streams, only certain IP addresses and port numbers should be used.

Select Always Multicast Video and/or Always Multicast Audio to start multicast streaming without opening an RTSP session.

Bonjour
The Axis product includes support for Bonjour. Bonjour is enabled by default and the product is automatically detected by operating systems and clients that support this protocol.

Bonjour can be disabled under System Options > Network > Bonjour.

Storage

SD Card

Notice
To prevent data corruption, the SD card should be unmounted before removal.

Note
For SD card recommendations see www.axis.com
AXIS M1033-W Network Camera

System Options

**Note**

Do not insert or eject the SD card while the product is running. The product will lose its connection to the wireless network. Reboot the product to reestablish the wireless connection after the card has been inserted or ejected.

The following SD card file systems are supported:

- **ext4** — recommended due to its resilience against data loss if the card is ejected or if there is abrupt power loss. To access data stored on the card from the Windows operating system, a third-party ext4 driver or application is required.
- **vFAT** — supported by most operating systems for personal computers.

The SD card is managed on the [System Options > Storage](#) page. Click SD Card to open [Storage Management](#).

If the card’s status shows as failed, click Check disk to see if the problem can be found and then try Repair. This option is only available for SD cards with ext4. For SD cards with vFAT, use a card reader or computer to troubleshoot the card.

To avoid filling the card, it is recommended to remove recordings continuously. Under General Settings, select Remove recordings older than and select the number of days or weeks.

To stop writing to the card and protect recordings from being removed, select Lock under General Settings.

**Mount and Unmount SD Card**

**NOTICE**

To prevent corruption of recordings, the SD card should always be unmounted before it is ejected.

The SD card is automatically mounted when the card is inserted into the Axis product or when the product is started. A manual mount is only required if the card has been unmounted and not ejected and re-inserted.

To unmount the SD card:

1. Open the Axis product’s webpages and go to Setup > System Options > Storage.
2. Click SD Card.
3. Click Unmount.
4. The card can now be removed.

**Format SD Card**

**NOTICE**

Formatting the SD card will remove all data and recordings stored on the card.

**Important**

If autoformat is enabled, only use new or empty SD cards. Any data stored on the card will be lost when the card is inserted into the Axis product.

An SD card inserted into the product can be manually formatted to one of the supported file systems. To manually format the SD card, follow these steps:

1. Insert the SD card in the SD card slot.
2. Open the Axis product’s webpages and go to Setup > System Options > Storage.
3. Click SD Card.
4. Click Format and select the desired file system.
5. Click OK to start formatting the card.
Network Share

Network share allows you to add network storage such as a NAS (network-attached storage). The NAS shall be dedicated for recordings and data from the Axis products connected to the network. For information about reference NAS devices, go to www.axis.com/products/cam_companion_software/supported.htm

Note

For NAS recommendations see www.axis.com

To add a network share:
1. Go to System Options > Storage.
2. Click Network Share.
3. Enter the IP address, DNS or Bonjour name to the host server in the Host field.
4. Enter the name of the share in the Share field. Sub folders cannot be used.
5. If required, select The share requires login and enter the user name and password.
6. Click Connect.

To clear all recordings and data from the Axis product’s folder on the designated share, click Clear under Storage Tools.

To avoid filling the share, it is recommended to remove recordings continuously. Under Recording Settings, select Remove recordings older than and select the number of days or weeks.

To stop writing to the share and protect recordings from being removed, select Lock under Recording Settings.

Ports & Devices

I/O Ports

The Axis product provides one input port and one output port for connection of external devices. For information about how to connect external devices, see Connectors on page 65.

The I/O ports are configured under System Options > Ports & Devices > I/O Ports. The ports can be given descriptive names and their Normal states can be configured as Open circuit or Grounded circuit.

Port Status

The list on the System Options > Ports & Devices > Port Status page shows the status of the product’s input and output ports.

Maintenance

The Axis product provides several maintenance functions. These are available under System Options > Maintenance.

Click Restart to perform a correct restart if the Axis product is not behaving as expected. This will not affect any of the current settings.

Note

A restart clears all entries in the Server Report.

Click Restore to reset most settings to the factory default values. The following settings are not affected:

- the boot protocol (DHCP or static)
- the static IP address
AXIS M1033-W Network Camera

System Options

- the default router
- the subnet mask
- the system time
- the IEEE 802.1X settings
- the wireless settings

Click Default to reset all settings, including the IP address, to the factory default values. This button should be used with caution. The Axis product can also be reset to factory default using the control button, see Reset to Factory Default Settings on page 58.

To identify the product or test the Status LED, click Flash LED under Identify and specify the duration in seconds, minutes or hours. This can be useful for identifying the product among other products installed in the same location.

For information about firmware upgrade, see Upgrade the Firmware on page 59.

Support

Support Overview

The System Options > Support > Support Overview page provides information on troubleshooting and contact information, should you require technical assistance.

See also Troubleshooting on page 59.

System Overview

To get an overview of the Axis product’s status and settings, go to System Options > Support > System Overview. Information that can be found here includes firmware version, IP address, network and security settings, event settings, image settings and recent log items. Many of the captions are links to the proper Setup page.

Logs & Reports

The System Options > Support > Logs & Reports page generates logs and reports useful for system analysis and troubleshooting. If contacting Axis Support, please provide a valid Server Report with your query.

System Log – Provides information about system events.

Access Log – Lists all failed attempts to access the product. The Access Log can also be configured to list all connections to the product (see below).

Parameter List – Shows the product’s parameters and their current settings. This may prove useful when troubleshooting or when contacting Axis Support.

Connection List – Lists all clients that are currently accessing media streams.

Crash Report – Generates an archive with debugging information. The report takes several minutes to generate.

The log levels for the System Log and the Access Log are set under System Options > Support > Logs & Reports > Configuration. The Access Log can be configured to list all connections to the product (select Critical, Warnings & Info).
Advanced

Scripting

Scripting allows experienced users to customize and use their own scripts.

**NOTICE**

Improper use may cause unexpected behavior and loss of contact with the Axis product.

Axis strongly recommends that you do not use this function unless you understand the consequences. Axis Support does not provide assistance for problems with customized scripts.

To open the Script Editor, go to System Options > Advanced > Scripting. If a script causes problems, reset the product to its factory default settings, see page 58.

For more information, see www.axis.com/developer

File Upload

Files, for example webpages and images, can be uploaded to the Axis product and used as custom settings. To upload a file, go to System Options > Advanced > File Upload.

Uploaded files are accessed through http://<ip address>/local/<user>/<file name> where <user> is the selected user group (viewer, operator or administrator) for the uploaded file.

Plain Config

Plain Config is for advanced users with experience of Axis product configuration. Most parameters can be set and modified from this page.

To open Plain Config, go to System Options > Advanced > Plain Config. Axis Support does not provide assistance.

Reset to Factory Default Settings

**Important**

Reset to factory default should be used with caution. A reset to factory default will reset all settings, including the IP address, to the factory default values.

**Note**

The installation and management software tools are available on the CD supplied with the product and from the support pages on www.axis.com/techsup

To reset the product to the factory default settings:

1. Disconnect power from the product.
2. Press and hold the control button and reconnect power. See Hardware Overview on page 8.
3. Keep the control button pressed for about 15–30 seconds until the status LED indicator flashes amber.
4. Release the control button. The process is complete when the status LED indicator turns green. The product has been reset to the factory default settings. If no DHCP server is available on the network, the default IP address is 192.168.0.90.
5. Using the installation and management software tools, assign an IP address, set the password, and access the video stream.

It is also possible to reset parameters to factory default via the web interface. Go to Setup > System Options > Maintenance.
AXIS M1033-W Network Camera

Troubleshooting

Check the Firmware

Firmware is software that determines the functionality of network devices. One of your first actions when troubleshooting a problem should be to check the current firmware version. The latest version may contain a correction that fixes your particular problem. The current firmware version in the Axis product is displayed in the page Setup > Basic Setup and in Setup > About.

Upgrade the Firmware

Important

- Your dealer reserves the right to charge for any repair attributable to faulty upgrade by the user.
- Preconfigured and customized settings are saved when the firmware is upgraded (providing the features are available in the new firmware) although this is not guaranteed by Axis Communications AB.

Note

- After the upgrade process has completed, the product will restart automatically. If restarting the product manually after the upgrade, always wait 10 minutes even if you suspect the upgrade has failed.
- When you upgrade the Axis product with the latest firmware from Axis website, the product receives the latest functionality available. Always read the upgrade instructions and release notes available with each new release before upgrading the firmware.

To upgrade the product’s firmware:

1. Save the firmware file to your computer. The latest version of the firmware is available free of charge from Axis website at www.axis.com/techsup
2. Go to Setup > System Options > Maintenance in the product’s webpages.
3. Under Upgrade Server, click Browse and locate the file on your computer. Click Upgrade.
4. Wait approximately 10 minutes while the product is being upgraded and restarted. Then access the product.

AXIS Camera Management can be used for multiple upgrades. See www.axis.com for more information.

Emergency Recovery Procedure

If power or network connection is lost during the upgrade, the process fails and the product becomes unresponsive. Flashing red Status indicator indicates a failed upgrade. To recover the product, follow the steps below. The serial number is found on the product’s label.

1. In UNIX/Linux, type the following from the command line:
   ```
   arp -s <IP address> <serial number> temp
   ping -1 408 <IP address>
   ```
   In Windows, type the following from a command/DOS prompt (this may require that you run the command prompt as an administrator):
   ```
   arp -s <IP address> <serial number>
   ping -1 408 -t <IP address>
   ```
2. If the product does not reply in 30 seconds, restart it and wait for a reply. Press CTRL+C to stop Ping.
3. Open a browser and type in the product’s IP address. In the page that opens, use the Browse button to select the upgrade file to use. Then click Load to restart the upgrade process.
4. After the upgrade is complete (1–10 minutes), the product automatically restarts and shows a steady green on the Status indicator.
**AXIS M1033-W Network Camera**

**Troubleshooting**

5. Reinstall the product, referring to the Installation Guide.

If the emergency recovery procedure does not get the product up and running again, contact Axis support at www.axis.com/techsup/

**Note**

The emergency recovery procedure only works on the wired interface.

**Symptoms, Possible Causes and Remedial Actions**

### Problems setting the IP address

<table>
<thead>
<tr>
<th>When using ARP/Ping</th>
<th>The product is located on a different subnet</th>
<th>The IP address is being used by another device</th>
</tr>
</thead>
</table>
| Try the installation again. The IP address must be set within two minutes after power has been applied to the product. Ensure the Ping length is set to 408. For instructions, see Assign IP Address Using ARP/Ping on page 46. | If the IP address intended for the product and the IP address of the computer used to access the product are located on different subnets, you will not be able to set the IP address. Contact your network administrator to obtain an IP address. | Disconnect the Axis product from the network. Run the Ping command (in a Command/DOS window, type ping and the IP address of the product):

- If you receive: Reply from <IP address>: bytes=32; time=10...
  this means that the IP address may already be in use by another device on the network. Obtain a new IP address from the network administrator and reinstall the product.
- If you receive: Request timed out, this means that the IP address is available for use with the Axis product. Check all cabling and reinstall the product. |

### Possible IP address conflict with another device on the same subnet.

The static IP address in the Axis product is used before the DHCP server sets a dynamic address. This means that if the same default static IP address is also used by another device, there may be problems accessing the product.

### The product cannot be accessed from a browser

<table>
<thead>
<tr>
<th>Cannot log in</th>
<th>The IP address has been changed by DHCP</th>
<th>Certificate error when using IEEE 802.1X</th>
</tr>
</thead>
<tbody>
<tr>
<td>When HTTPS is enabled, ensure that the correct protocol (HTTP or HTTPS) is used when attempting to log in. You may need to manually type http or https in the browser’s address field.</td>
<td>IP addresses obtained from a DHCP server are dynamic and may change. If the IP address has been changed, use AXIS IP Utility or AXIS Camera Management to locate the product on the network. Identify the product using its model or serial number, or by the DNS name (if the name has been configured).</td>
<td>For authentication to work properly, the date and time settings in the Axis product should be synchronized with an NTP server. See Date &amp; Time on page 45.</td>
</tr>
</tbody>
</table>

### The product is accessible locally but not externally

<table>
<thead>
<tr>
<th>Router configuration</th>
<th>Firewall protection</th>
<th>Default routers required</th>

### Troubleshooting

#### Problems with streaming H.264

<table>
<thead>
<tr>
<th>Problem</th>
<th>Solution</th>
</tr>
</thead>
<tbody>
<tr>
<td>Problems with AXIS Media Control (Internet Explorer only)</td>
<td>To enable the updating of video images in Internet Explorer, set the browser to allow ActiveX controls. Also, make sure that AXIS Media Control is installed on your computer.</td>
</tr>
<tr>
<td>No H.264 displayed in the client</td>
<td>Check that the relevant H.264 connection methods and correct interface are enabled in the AMC Control Panel (streaming tab). See AXIS Media Control (AMC) on page 16. In the AMC Control Panel, select the H.264 tab and click Set to default H.264 decoder.</td>
</tr>
<tr>
<td>Multicast H.264 only accessible by local clients</td>
<td>Check that RTSP is enabled under System Options &gt; Network &gt; TCP/IP &gt; Advanced.</td>
</tr>
<tr>
<td>No multicast H.264 displayed in the client</td>
<td>Check if your router supports multicasting, or if the router settings between the client and the product need to be configured. The TTL (Time To Live) value may need to be increased. Check with your network administrator that the multicast addresses used by the Axis product are valid for your network. Check with your network administrator to see if there is a firewall preventing viewing.</td>
</tr>
<tr>
<td>Installation of additional ActiveX component restricted or prohibited</td>
<td>Configure the Axis product to use a Java applet for updating video images in your browser. Go to Setup &gt; Live View Config and select Java applet under Default viewer.</td>
</tr>
<tr>
<td>Poor rendering of H.264 images</td>
<td>Ensure that your graphics card is using the latest driver. The latest drivers can usually be downloaded from the manufacturer's website.</td>
</tr>
<tr>
<td>Color saturation is different in H.264 and Motion JPEG</td>
<td>Modify the settings for your graphics adapter. Refer to the adapter's documentation for more information. See Performance Considerations on page 66.</td>
</tr>
<tr>
<td>Lower frame rate than expected</td>
<td>Reduce the number of applications running on the client computer. Limit the number of simultaneous viewers. Check with the network administrator that there is enough bandwidth available. Check in the AMC Control Panel (H.264 tab) that video processing is NOT set to Decode only key frames. Lower the image resolution.</td>
</tr>
</tbody>
</table>

#### Status and Network indicator LEDs are flashing red rapidly

<table>
<thead>
<tr>
<th>Problem</th>
<th>Solution</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hardware failure</td>
<td>Contact your Axis reseller.</td>
</tr>
</tbody>
</table>

#### Product does not start up

<table>
<thead>
<tr>
<th>Problem</th>
<th>Solution</th>
</tr>
</thead>
<tbody>
<tr>
<td>Product does not start up</td>
<td>If the product does not start up keep the network cable connected and re-insert the power cable to the midspan.</td>
</tr>
</tbody>
</table>

#### Video and image problems, general

<table>
<thead>
<tr>
<th>Problem</th>
<th>Solution</th>
</tr>
</thead>
<tbody>
<tr>
<td>Image unsatisfactory</td>
<td>Check the video stream and camera settings under Setup &gt; Video &amp; Audio &gt; Video Stream and Setup &gt; Video &amp; Audio &gt; Camera Settings.</td>
</tr>
</tbody>
</table>

#### Motion Detection triggers unexpectedly

<table>
<thead>
<tr>
<th>Problem</th>
<th>Solution</th>
</tr>
</thead>
<tbody>
<tr>
<td>Changes in luminance</td>
<td>Motion detection is based on changes in luminance in the image. This means that if there are sudden changes in the lighting, motion detection may trigger mistakenly. Lower the sensitivity setting to avoid problems with luminance.</td>
</tr>
</tbody>
</table>
### Troubleshooting

#### No audio

**Incorrect setup**  
Check the sound card in the computer. Ensure that mute is not selected and that the volume settings are correct.  
Check that Enable audio support is selected under Setup > System Options > Security > Audio Support.  
Check that the correct Audio Input source is selected under Setup > Video & Audio > Audio Settings.

#### Poor audio quality

**Stuttering**  
Reduce the number of listeners and viewers. Decrease image resolution and compression.

**Unsynchronized audio and video using H.264**  
Synchronize the product’s date and time settings with an NTP server. Go to Setup > System Options > Date & Time.

**Distorted audio**  
Check that the correct Audio Input source is selected under Setup > Video & Audio > Audio Settings.

**Feedback loops**  
Feedback loops might appear in full-duplex mode. Try moving the microphone or the speaker, or use half-duplex mode instead.

#### Storage and disk management problems

**Storage disruption**  
A storage disruption alarm is sent if a storage device is unavailable, removed, full, locked or if other read or write problems occur. To identify the source of the problem, check the System Log under System Options > Support > Logs & Reports. Depending on the problem, it might be necessary to re-mount the storage device.

For information on how to set up a storage disruption alarm, see *Events on page 35*.

**Video cannot be recorded**  
Check that the SD card is not write protected (that is, read only).

**SD card cannot be mounted**  
Reformat the SD card and then click Mount.  

**NOTICE**  
Formatting the card will remove all content, including all recordings, from the SD card.

#### PIR Sensor sensitivity

**The PIR sensor rarely triggers or not at all**  
Since IR light is blocked by glass, the PIR sensor will not work if the product is placed behind a window or similar.

### Connectors

#### I/O Connector

4-pin terminal block

![I/O Connector Diagram](image)

For an example diagram, see *Connection Diagrams on page 66.*
Function | Pin | Notes | Specifications
--- | --- | --- | ---
0 V DC (-) | 1 | | 0 V DC
DC output | 2 | Can be used to power auxiliary equipment. Note: This pin can only be used as power out. | 3.3 V DC Max load = 50 mA
Digital input | 3 | Connect to pin 1 to activate, or leave floating (unconnected) to deactivate | 0 to max 40 V DC
Digital output | 4 | Connected to pin 1 when activated, floating (unconnected) when deactivated. If used with an inductive load, e.g. a relay, a diode must be connected in parallel with the load, for protection against voltage transients. | 0 to max 40 V DC, open drain, 100 mA

Connection Diagrams

I/O Connector

![Connection Diagram](image)

1 0 V DC (-)
2 DC output 3.3 V, max 50 mA
3 Digital input 0 to max 40 V DC
4 Digital output 0 to max 40 V DC, open drain, 100 mA

Performance Considerations

When setting up your system, it is important to consider how various settings and situations will affect performance. Some factors affect the amount of bandwidth (the bit rate) required, others can affect the frame rate, and some affect both. If the load on the CPU reaches its maximum, this will also affect the frame rate.

The following factors are among the most important to consider:

- High image resolution and/or lower compression levels result in images containing more data. Bandwidth affected.
- Access by large numbers of Motion JPEG and/or unicast H.264 clients. Bandwidth affected.
- Simultaneous viewing of different streams (resolution, compression) by different clients. Effect on frame rate and bandwidth.
AXIS M1033-W Network Camera

Technical Specifications

• Accessing Motion JPEG and H.264 video streams simultaneously. Frame rate and bandwidth affected.
• Heavy usage of event settings affect the product’s CPU load. Frame rate affected.
• Using HTTPS may reduce frame rate, in particular if streaming Motion JPEG.
• Heavy network utilization due to poor infrastructure. Bandwidth affected.
• Viewing on poorly performing client computers lowers perceived performance. Frame rate affected.
• Running multiple AXIS Camera Application Platform (ACAP) applications simultaneously may affect performance.
• If the product includes several camera units, running applications on multiple cameras may affect the frame rate.
